General Information 9,10-Anthracenediyi-l-bis(methylene)dimalonic acid (ABDA), 3-(4,5-dimethyl- thiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT), and other chemicals were all purchased from Sigma-Aldrich and used as received without further purification. Compound NTPE-DCV, 1 and 2 were synthesized according to previous published procedure[1]. Dry dichloromethane and dimethylformamide (DMF) were distilled over CaH₂. All non-aqueous reactions were carried out in oven-dried glassware under nitrogen atmosphere. High-performance liquid chromatography (HPLC) was performed in Agilent technologies (1200 series) with acetonitrile containing trifluoroacetic acid (0.1%) and water containing trifluoroacetic acid (0.1%) as the elution buffer. NMR spectra were recorded on a Bruker ARX 400/500 NMR spectrometer. Chemical shifts were recorded in parts per million referenced according to residual solvent ((CD₃)₂SO = 2.50 ppm and CDCl₃ = 7.26 ppm) in ¹H NMR and ((CD₃)₂SO = 40.0 ppm and CDCl₃ = 77.0 ppm) in ¹³C NMR. Mass spectra were reported on the AmaZon X LC-MS for ESI.

UV absorption spectra were recorded in the UV-visible spectrophotometer (SHIMADZU, UV-1700). PL spectra were recorded in the luminescence spectrometer (PerkinElmar, LS 55). All the measurements were carried out at room temperature.

11. Cell culture

HeLa cells were provided by American Type Culture Collection (ATCC). The cells were cultured in DMEM (Invitrogen, Carlsbad, CA) containing 10% heat-inactivated FBS (Invitrogen), 100 U mL$^{-1}$ penicillin, and 100 μg mL$^{-1}$ streptomycin (Thermo Scientific) and were maintained in a humidified incubator at 37 °C with 5% CO$_2$. Before experiments, the cells were pre-cultured until confluence was reached.

12. Intracellular localization of TPECA-ER

HeLa cells were sub-cultured in the 8-well chambers (LAB-TEK, Chambered Coverglass System) at a density of $5 \times 10^5$ per mL for 18 h. The culture medium was removed, and the cells were rinsed with 1×PBS. The cells were incubated with TPECA-ER (5 μM) for 30 min, followed by incubation with ER tracker (500 nM) for 30 min at 37 °C. After washing with 1×PBS for twice, the cells were imaged by confocal laser scanning microscope (Leica SP8, Germany). The excitation wavelength for ER tracker and TPECA-ER were 405 nm and 488 nm, respectively. The fluorescence signal were collected at the range of 420-500 nm (ER tracker) and 550-
13 Cell cytotoxicity assay
The cytotoxicity of TPECA-ER in dark or under light irradiation was evaluated using the MTT assay. The HeLa cells were seeded in 96-well plates at a density of $1 \times 10^5$ cells/well. After incubation for 24 h, the medium was replaced with freshly prepared medium containing different concentrations of TPECA-ER. The cells were further incubated at 37 °C for 2 h in the dark and washed with 1× PBS for three times. After adding fresh medium, the cells were irradiated under white light for 3 min at the power of 0.25 W cm$^{-2}$ while the control groups were kept under dark environment. The cells were further incubated for 24 h and washed with 1×PBS. 100 μL of freshly prepared MTT (0.5 mg mL$^{-1}$) solution in 1×PBS was added into each well and kept at 37 °C for 3 h. The MTT medium was removed and the formazan crystals were dissolved in DMSO. The cell viability was calculated by measuring the absorbance at 570 nm using a microplate reader (Genios Tecan).

14 Photostability test
HeLa cells were cultured in the chambers (LAB-TEK, Chambered Coverglass System) at a density of $5 \times 10^5$ per mL for 18 h. The culture medium was removed, and the cells were rinsed with 1×PBS. Two groups of cells were incubated with TPECA-ER (5 μM) or ER tracker (500 nM) for 30 min at 37 °C, respectively. After washing with 1×PBS for 3 times, the cells were fixed by 4% formaldehyde and scanned by confocal laser scanning microscope (Leica SP8, Germany) for 60 times. The excitation wavelength for ER tracker and TPECA-ER were 405 nm and 488 nm, respectively. The fluorescence signal were collected at the range of 420-500 nm (ER tracker) and 560-800 nm (TPECA-ER). The change of fluorescence intensity after each scan were measured and plotted to reveal the photostability of ER tracker and TPECA-ER.
