General information

Procedures were all carried out in flame-dried flasks with anhydrous solvents under argon protection. Analytical thin-layer chromatography was conducted on precoated glass-backed plates (Silica Gel 60 F$_{254}$, Merck). Visualization was performed by UV light (254nm), aqueous ceric ammonium molybdate (CAM), p-Anisaldehyde Stain, aqueous basic potassium permanganate stains ($\text{KMnO}_4$) and vanillin solution. Flash column chromatography was carried out using Apollo Scientific silica gel 60 (0.040 – 0.063 nm), VWR (40-63 μm) silica gel, Sigma Aldrich silica gel. Reaction temperatures below 0 °C were obtained using a Julabo FT902 immersion cooler. 0 °C was achieved using an ice-water bath. Light sensitive reactions were processed under Aluminium foil protection.

All NMR spectra were recorded at room temperature; $^1$H and $^{13}$C nuclear magnetic resonance experiments were carried out using Bruker DPX-200 (200/50 MHz), AVG-400 (400/100 MHz), AVH-400 (400/100 MHz) or AVC-500 (500/125 MHz) spectrometers. Chemical shifts are reported in ppm from the residual solvent peak. Chemical shifts (δ) are given in ppm and coupling constants (J) are quoted in hertz (Hz). Resonances are described as s (singlet), d (doublet), t (triplet), q (quartet) and m (multiplet). Assignments were made with the assistance of COSY, DEPT-135, HSQC and NOESY NMR spectra.

Chiral HPLC separations were achieved using an Agilent 1230 Infinity series normal phase HPLC unit and HP Chemstation software. Chiralpak® columns (250 × 4.6 mm), fitted with matching Chiralpak® Guard Cartridges (10 × 4 mm), were used as specified in the text. Solvents used were of HPLC grade (Fisher Scientific, Sigma Alrich or Rathburn); all eluent systems were isocratic.

Low-resolution mass spectra were recorded using a Walters LCT premier XE. High-resolution mass spectra (EI and ESI) were recorded using a Bruker Micro TOF spectrometer by the internal service at the University of Oxford.

Infrared measurements (ATR) were carried out using a Bruker Tensor 27 FT-IR with internal calibration in the range 4000-600 cm$^{-1}$.

Optical rotations were recorded using a Perkin-Elmer 241 Polarimeter; in those cases where silver salts were used the resulting solutions were filtered using syringe filters PTFE (0.2 μm, 13 mm diameter) from Camlab.
Chemicals

Unless stated otherwise, commercially available reagents were purchased from Sigma-Aldrich, Fisher Scientific, Apollo Scientific, Acros Organics, Strem Chemicals, Alfa Aesar or TCI UK and were used without purification. Petroleum ether refers to petroleum boiling in the range 40-60°C. Deuterated solvents were purchased from Sigma-Aldrich (CDCl₃). Schwartz reagent was prepared according to the literature procedure from Cp₂ZrCl₂ provided by Alfa Aesar. CuCl which purity is 98% is purchased from Strem Chemicals, the 99.99% purity CuCl is from Sigma-Aldrich, and all of them were directly used without any further purification. All the Trimethylsilyl chloride (TMSCl) were distilled fresh and stored in Schlenk flasks under an argon atmosphere. All phosphoramidite ligands were synthesized by the Fletcher group.

General Methods

1. Preparation of Schwartz reagent

\[
\text{Cp}_2\text{ZrCl}_2 \xrightarrow{\text{LiAlH}_4} \text{Cp}_2\text{ZrCl} + \text{Cp}_2\text{ZrH}_2
\]

Zirconocene dichloride (30.0 g, 0.103 mol) was added to a flame-dry 250 mL Schlenk flask wrapped with aluminium foil under argon. Dry THF (120 mL) was added and the suspension was stirred at 35 °C for 30 minutes. LiAlH₄ in Et₂O (1 M, 28.2 mmol) was added dropwise to the mixture over about 30 minutes. The resulting suspension was stirred at room temperature for 2 hours. The mixture was then Schlenk-filtered under argon and washed with tetrahydrofuran (200 mL), methylene chloride (200 mL), and diethyl ether (200 mL). The precipitate was dried under high vacuum for two hours to give a white powder (20.3 g, 75%), which is stored under argon in a small flame-dried schlenk flask while being protected from light.

2. Preparation of S-ethyl 2-(diethoxyphosphoryl)ethanethioate

\[
\text{EtOPO} = \text{O} + \text{SH} \xrightarrow{\text{DCC, DMAP}} \text{EtOPO} = \text{OSEt}
\]

S-ethyl 2-(diethoxyphosphoryl)ethanethioate (EtO₂POCH₂C(SH)CH₂PO(OEt)₂) was prepared by the reaction of diethylphosphorylacetic acid and thiophenol in the presence of DCC and DMAP as described in the literature.
A solution of diethylphosphonoacetic acid (1.0 eq.), ethanethiol (1.0 eq.), and DMAP (0.1 eq.) in DCM was cooled to 0°C. DCC (1.0 eq.) was added in portions. The reaction mixture was left to stir overnight under argon at room temperature. The mixture was filtered through a Celite pad, and DCM was used to rinse the pad. The organic layer was washed with aqueous NaHCO₃, water and brine. The organic phase was dried with anhydrous Na₂SO₄, and the solvent was removed under reduced pressure. The product was further purified by flash chromatography (ether: pentane) to a colourless oil.

3. Preparation of amines³

\[ R\cdot NH₂ + \underset{\text{O}}{\text{R}_1\text{R}_2} \rightarrow \underset{\text{H₂N}}{\text{R}_1\text{R}_2} \quad \text{R = alkyl, H} \]

According to a modified procedure from Davies and co-workers³. Ketone (2.0 eq.) was added to a stirring solution of amine in THF at room temperature. After 5 minutes, Na(OAc)₃H (2.0 eq.) was tipped into the mixture. The reaction was kept under room temperature for 48 hours, and the resulting suspension was added to a 1:1 mixture of Et₂O and NaHCO₃ (aq. sat.) and stirred for another half an hour. The mixture was partitioned between the aqueous and Et₂O layers and the aqueous phase extracted with Et₂O three times. The combined organic phase was concentrated in vacuo. Then HCl (aq. 2 M) was added dropwise (pH = 1). The mixture was partitioned between the aqueous and organic phases, and the organic phase was extracted with HCl (aq. 2.0 M). Then DCM was added to the combined aqueous phases and NaOH (4 M) was added till the mixture became basic (pH > 14). The mixture was partitioned between aqueous and organic phases. DCM was used to extract residual product from the aqueous layer (three extracts). The combined organic layers were concentrated, dried (MgSO₄), filtered and concentrated to give the desired product.

4. Preparation of phosphoramidite ligands⁴

\[ \begin{array}{c}
\text{OH} \\
\text{OH}
\end{array} + \underset{\text{HN}}{\text{R}_1\text{R}_2} \xrightarrow{\text{PCl₃}} \begin{array}{c}
\text{O} \\
\text{O}\end{array} \quad \text{R₁ = Alkyl, Aryl} \\
\text{R₂ = Alkyl, Aryl}
\]

Triethylamine (5.0 eq.) was added dropwise to a stirred, ice-cooled solution of PCl₃ (1.0 eq.) in DCM. The ice bath was removed and the solution left to warm to room temperature before
(S)-N-cyclohexyl-2, 3-dihydro-1H-inden-1-amine (1.0 eq.) was added to the stirred solution in one portion. After 5 hours, (S)-binaphthol (1.0 eq.) was tipped into the suspension and the reaction mixture was left to stir for another 15 hours. The mixture was then filtered over an ~2cm pad of celite and silica gel, and DCM was used to rinse the pad. The filtrate was concentrated to give a yellow residue and after flash column chromatography (petroleum ether: DCM: Et₃N, 80:20:1; SiO₂) the ligand was obtained as a white crystalline solid.

5. Preparation of unsaturated thioester

**General procedure a** (from unsaturated ester)

Me₃SiSEt (2.0 eq.) and AlCl₃ (1.2 eq.) were added to a solution of α,β-unsaturated ester (1.0 eq) in THF. The resulting mixture was stirred at reflux for 3 hours and the quenched at rt by addition of aqueous phosphate buffer solution (pH 7). The reaction mixture was partitioned between the aqueous and organic phases, and the aqueous layer extracted by Et₂O three times. The combined organic materials were dried over MgSO₄, filtered, concentrated, and further purified by flash column chromatography (pentane: Et₂O; SiO₂) to afford the desired α,β-unsaturated thioester.

**General procedure b** HWE olefination (from aldehyde)

n-BuLi (1.5 eq. solution in hexane) was added to a stirring solution of (EtO)₂POCHCOEt (1.5 eq.) in THF at 0°C under argon. The mixture was stirred for another 20 min. A solution of aldehyde (1.0 eq.) in THF was added dropwise. The mixture was slowly warmed to room temperature and was continued overnight. The mixture was quenched with aqueous NH₄Cl (sat.). The reaction mixture was partitioned between the aqueous and organic phases, and the aqueous layer extracted by Et₂O three times. The combined organic materials were dried (MgSO₄), filtered, concentrated, and further purified by flash column chromatography (pentane: Et₂O; 98:2; SiO₂) to afford the desired α,β-unsaturated thioester.

6. Pd-catalyzed reduction of thioesters to aldehydes
DIBAL (1.0 eq.) was added to a stirring mixture of thioester (1.0 eq) in DCM at -78°C under argon. The mixture was kept stirring until the reduction was completed (30-60 min). After that sat. Rochelle salt solution was added and Et₂O extracted the mixture three times. The combined organic materials were dried (Na₂SO₄), filtered, concentrated, and the resulting yellow residual purified by flash column chromatography (Petrol: Et₂O; 90:10; SiO₂) to give the desired product.

7. Copper catalysed conjugate addition of alkylzirconium nucleophiles

\[
\begin{align*}
\text{R} & \quad \text{R} \\
\text{H} & \quad \text{H} \\
\text{Et} & \quad \text{Et} \\
\end{align*}
\]

a. Racemic product

CuCl (0.2 eq.), and the racemic phosphoramidite ligand (0.2 eq.) were added to a flame dried round bottom flask containing DCM/ Et₂O (1/1) under argon and the resulting mixture was stirred at room temperature. After 1 hour, AgOTf (0.22 eq.) was added and the mixture was stirred for an additional 15 min.

To a second, flame dried, round bottom flask, containing a stirred solution of alkene (2.5 eq.) in DCM, under an argon atmosphere was added Cp₂ZrHCl (2.0 eq.), and after stirring for 15 min, a clear yellow solution was obtained.

The stirred solution containing the copper and ligand was transferred, and filtered – using a syringe filter, to the solution containing the zirconocene species. The resulting black mixture was stirred for another 10 min before enone and TMSCl were sequentially added dropwise over about 1 min for each. Stirring at room temperature was continued for 15 additional hours, before the reaction was quenched by the addition of NH₄Cl (sat. aq.) and then Et₂O. The reaction mixture was partitioned between the aqueous and organic phases, and the aqueous layer extracted by Et₂O. The combined organic materials were dried (Na₂SO₄), filtered, concentrated, and the resulting yellow residual purified by flash column chromatography (Petrol: Et₂O; 98:2; SiO₂) to give the desired product.

1b. Asymmetric product (gaseous alkenes)
CuCl (0.2 eq.), and the phosphoramidite ligand (0.2 eq.) were added to a flame dried round bottom flask containing x ml DCM/Et₂O (1/1) under argon and the resulting mixture was stirred at room temperature. After 1 hour, AgOTf (0.22 eq.) was added and the mixture was stirred for an additional 15 min. To a second, flame dried, round bottom flask, Cp₂ZrHCl (2.0 eq.) was added. A balloon filled with ethylene was used to purge the flask with ethylene for 5 min, and then DCM (xx mL) was added. After stirring for 15 min under an ethylene atmosphere (balloon), a clear yellow solution was obtained. After stirring for 15 min, the stirred solution containing the copper and ligand was transferred, and filtered – using a syringe filter, to the solution containing the zirconocene species. The resulting black mixture was stirred for another 10 min before the enone (1.0 eq.) and then TMSCl (5.0 eq.) were each added dropwise. Stirring was continued for 40 h at 0 °C, before the reaction was quenched by the addition of NH₄Cl and then Et₂O. The mixture was partitioned between the aqueous and organic phases, and the aqueous layer was extracted with Et₂O. The combined organic materials were dried with Na₂SO₄, filtered, concentrated, and the resulting yellow residual purified by flash column chromatography (Petrol: Et₂O; 98:2; SiO₂) to give the desired product.

2b. Asymmetric product (liquid alkenes)

CuCl (0.2 eq.), and the phosphoramidite ligand (0.2 eq.) were added to a flame dried round bottom flask containing x ml DCM/Et₂O (1/1) under argon and the resulting mixture was stirred at room temperature. After 1 hour, AgOTf (0.22 eq.) was added and the mixture was stirred for an additional 15 min.

To a second, flame dried, round bottom flask, containing a stirred solution of alkene (2.5 eq.) in DCM, under an argon atmosphere was added Cp₂ZrHCl (2.0 eq.), and after stirring for 15 min, a clear yellow solution was obtained.

The stirred solution containing the copper and ligand was transferred, and filtered – using a syringe filter, to the solution containing the zirconocene species. The resulting black mixture was stirred for another 10 min before enone and TMSCl were sequentially added dropwise over about 1 min for each. Stirring at 0 °C was continued for 40 additional hours, before the reaction was quenched by the addition of NH₄Cl (sat. aq.) and then Et₂O. The reaction mixture was partitioned between the aqueous and organic phases, and the aqueous layer extracted by Et₂O. The combined organic materials were dried (Na₂SO₄), filtered, concentrated, and the
resulting yellow residual purified by flash column chromatography (Petrol: Et₂O; 98:2; SiO₂) to give the desired product.

**Characterization of compounds**

**(+)-(R)-N-cyclooctyl-2,3-dihydro-1H-infen-1-amine**

![Chemical Structure Image]

According to a modified procedure from Davies and co-workers, cyclooctanone (1.47 g, 1.5 eq. 11.6 mmol) was added to a stirring solution of (R)-(+) 1-Aminoindane (1.00 mL, 1.0 eq. 7.76 mmol) in THF at room temperature. After 5 minutes, Na (OAc)₃H (2.50 g, 1.5 eq., 11.6 mmol) was tipped into the mixture. The reaction was kept under room temperature for 48 hours, and the resulting suspension was added to a 1:1 mixture of Et₂O and NaHCO₃ (aq. sat.) and stirred for another half an hour. The mixture was partitioned between the aqueous and Et₂O layers and the aqueous phase extracted with Et₂O three times. The combined organic phase was concentrated in vacuo. Then HCl (aq. 2 M) was added dropwise (25 ml, pH = 1). The mixture was partitioned between the aqueous and organic phases, and the organic phase was extracted with HCl (aq. 2.0 M). Then DCM was added to the combined aqueous phases and NaOH (4 M) was added till the mixture became basic (pH > 14). The mixture was partitioned between aqueous and organic phases. DCM was used to extract residual product from the aqueous layer (three extracts). The combined organic layers were concentrated, dried (MgSO₄), filtered and concentrated to give the desired product, (1.692 g, 90%) as dark oil.

(−)N-cyclooctyl-N-((R)-2,3-dihydro-1H-inden-1-yl)dinaphtho[2,1-d:1',2'-f][1,3,2]dioxaphosphepin-4-amine (R)-D

Triethylamine (2.92 mL, 5.0 eq., 20.5 mmol), was added dropwise to a stirred, ice-cooled solution of PCl₃ (0.38 mL, 1.0 eq., 4.1 mmol) in DCM. The ice bath was removed and the solution left to warm to room temperature before (R)-N-cyclohexyl-2,3-dihydro-1H-inden-1-amine (0.94 ml, 1.0 eq. 4.1 mmol) was added to the stirred solution in one portion. After 5 hours, (R)-binaphthol (1.12 g, 1.0 eq. 4.1 mmol) was tipped into the suspension and the reaction mixture was left to stir for another 15 hours. The mixture was then filtered over an ~2 cm pad of celite and silica gel, and DCM (~100 mL) was used to rinse the pad. The filtrate
was concentrated to give a yellow residue and after flash column chromatography (petroleum ether: DCM: Et$_3$N, 80:20:1; SiO$_2$) the ligand was obtained as a white crystalline solid (1.17 g, 51%).

(-)-S-ethyl (R)-3-(thiophen-3-yl)pentanethioate(3e)

CuCl (4.0 mg, 0.04 mmol, 0.2 eq.), and the phosphoramidite ligand (22.3 mg, 0.04 mmol 0.2 eq.) were added to a flame dried round bottom flask containing 1.6 ml DCM/Et₂O (1/1) under argon and the resulting mixture was stirred at room temperature. After 1 hour, AgOTf (11.2 mg, 0.44 mmol, 0.22 eq.) was added and the mixture was stirred for an additional 15 min. A balloon filled with ethylene was used to purge the flask with ethylene for 5 min, and then DCM (0.2 mL) was added. After stirring for 15 min under an ethylene atmosphere (balloon), a clear yellow solution was obtained. To a second, flame dried, round bottom flask was added Cp₂ZrHCl (103 mg, 0.4 mmol, 2.0 eq.), a balloon filled with ethylene was used to purge the flask with ethylene for 5 min, and then DCM (0.2 mL) was added. After stirring for 15 min under an ethylene atmosphere (balloon), a clear yellow solution was obtained.

The stirred solution containing the copper and ligand was transferred, and filtered – using a syringe filter, to the solution containing the zirconocene species. The resulting black mixture was stirred for another 10 min before S-ethyl (E)-3-(thiophen-3-yl) prop-2-enethioate (40.0 mg, 0.2 mmol, 1.0 eq.) and TMSCl (0.127 ml, 1 mmol, 5.0 eq.) were sequentially added dropwise over about 1 min for each. Stirring at 0 °C was continued for 40 additional hours, before the reaction was quenched by the addition of NH₄Cl (1.5 ml sat. aq.) and then Et₂O (1.5 ml). The reaction mixture was partitioned between the aqueous and organic phases, and the aqueous layer extracted by Et₂O. The combined organic materials were dried (Na₂SO₄), filtered, concentrated, and the resulting yellow residual purified by flash column chromatography (Petrol: Et₂O; 98:2; SiO₂) to give the desired product (27 mg, 0.12 mmol, 60% yield).

$[\alpha]_{20}^{D} = +8.8$ ° (c 1.0, CHCl$_3$)

Absolute configuration assigned by analogy to compound 3d.
CuCl (4.0 mg, 0.04 mmol, 0.2 eq.), and the phosphoramidite ligand (22.3 mg, 0.04 mmol 0.2 eq.) were added to a flame dried round bottom flask containing 1.6 ml DCM/Et₂O (1/1) under argon and the resulting mixture was stirred at room temperature. After 1 hour, AgOTf (11.2mg, 0.44mmol, 0.22 eq.) was added and the mixture was stirred for an additional 15 min. To a second, flame dried, round bottom flask, containing a stirred solution of hexa-1, 5-diene (41 mg, 0.5mmol, 2.5 eq.) in DCM, under an argon atmosphere was added Cp₂ZrHCl (103mg, 0.4mmol, 2.0 eq.), and after stirring for 15 min, a clear yellow solution was obtained. The stirred solution containing the copper and ligand was transferred, and filtered – using a syringe filter, to the solution containing the zirconocene species. The resulting black mixture was stirred for another 10 min before S-ethyl (E)-5-phenylpent-2-enethioate (44.0 mg, 0.2mmol, 1.0 eq.) and TMSCl (0.127ml, 1mmol, 5.0eq.) were sequentially added dropwise over about 1 min for each. Stirring at 0 °C was continued for 40 additional hours, before the
reaction was quenched by the addition of NH$_4$Cl (1.5 ml sat. aq.) and then Et$_2$O. The reaction mixture was partitioned between the aqueous and organic phases, and the aqueous layer extracted by Et$_2$O. The combined organic materials were dried (Na$_2$SO$_4$), filtered, concentrated, and the resulting yellow residual purified by flash column chromatography (Petrol: Et$_2$O; 98:2; SiO$_2$) to give the desired product (39 mg, 0.13mmol, 64% yield).

HPLC analysis indicated an enantiomeric excess of 92 % [Chiralpak® IB; flow: 1.0 mL/min; hexane: ipa 99.5:0.5; λ = 210 nm; major enantiomer tR = 6.17 min; minor enantiomer, tR = 6.93 min].
