Part 1. General Information

1. Chemicals and Reagents

   All manipulations were carried out under an atmosphere of nitrogen using standard Schlenk or glove box techniques. The following anhydrous solvents were purchased from Acros, THF (99.5%, stabilized), MeCN (acetonitrile, 99.9%), DMF (N,N-dimethylformamide, 99.8%), DME (1,2-dimethoxyethane, 99%), DMSO (dimethyl sulfoxide, 99.7%), DMA (N,N-dimethylacetamide, 99.5%, extra pure), NMP (N-methylpyrrolidinone, 99.5%). 1,4-Dioxane (99.5%). DMI (N,N-1,3-dimethylimidazolidin-2-one, Aldrich) were purchased and used directly. Deuterated solvents were purchased and used as received (CDCl₃ from Maclin Co., China). NiCl₂ (Alfa Aesar), NiBr₂ (Alfa Aesar), NiI₂ (Alfa Aesar), Ni(COD)₂ (Strem), Ni(ClO₄)₂ (Alfa Aesar), Ni(acac)₂ (Maclin Co., China), NiCl₂·glyme (Strem), were used as received. Zinc powder (Aladdin, China) was activated with hydrochloric acid before use. Anhydrous MgCl₂ (Alfa Aesar) and Anhydrous LiCl₂ (TCI) was purchased, and used directly. Unless otherwise noted, all other reagents and starting materials were purchased from commercial sources and used without further purification.

2. Physical Method

   Column chromatography was performed using silica gel 300-400 mesh (purchased from Qingdao-Haiyang Co., China) as the solid support. All NMR spectra were recorded on Bruker Avance 500 MHz spectrometer at STP unless otherwise indicated. ¹H NMR and ¹³C NMR chemical shifts were reported in δ units, parts per million (ppm) relative to the chemical shift of residual solvent. Reference peaks for chloroform in ¹H NMR and ¹³C NMR spectra were set at 7.26 ppm and 77.00 ppm, respectively. High-resolution mass spectra (HRMS) were obtained using a Bruker APEXIII 7.0 and IonSpec 4.7 TESLA FTMS. Melting point was recorded on a micro melting point apparatus (X-4, YUHUA Co., Ltd, Gongyi, China).
Part 2. Preparation of Aryl Tosylates

A general procedure for the preparation of aryl tosylates: To a solution of an alcohol (20.0 mmol) in CH$_2$Cl$_2$ (70 mL) was added 150 mol % NEt$_3$ (4 mL, 30 mmol) and 20 mol % DMAP (0.488 g, 4 mmol). To solution of daidzein (3.0 mmol) in acetic anhydride (6.0 mL) was added pyridine (0.6 mL). The mixture was heated to reflux until consumption of daidzein, at which point it was poured into ice cold water (70 mL) to afford B as a white solid. The mixture was allowed to slowly warm to r.t., and the reaction was monitored by TLC. The reaction solvent was evaporated under reduced pressure. Then the residue was diluted with ethyl acetate (100 mL) and washed with 1M of HCl (aq, 30 mL × 5). The organic phase was collected, dried over anhydrous Na₂SO₄ overnight. After filtration and concentration, the crude mixture was washed with ethanol to afford compound C.

In a glove box, a suspension of Ni(cod)\(_2\) (330.4 mg, 1.20 mmol, 100 mol %) in 8 mL of dry THF was stirred for 1 minute in a 50 mL flame-dried Schlenk tube, at which point a solution of ligand L1b (322.1 mg, 1.20 mmol, 100 mol %) in 8 mL of dry THF was added dropwise. The resulting mixture was allowed to stir overnight at ambient temperature. A solution of methyl 4-iodobenzoate (314.4 mg, 1.20 mmol, 100 mol %) in 4 mL of dry THF was added via syringe. The resultant mixture was allowed to stir for 1 h. The solvent was removed under vacuum, and the residue was filtrated with a fritted funnel, and washed with diethyl ether (6×3mL). The brownish red solid was collected, and further stirred in ether (50 mL) to dissolve aryl dimer. After filtration, and dried in vacuum, the title compound was obtained in ~70% yield (494.7 mg, 0.84 mmol, with trace THF and diethyl ether), which was stored in the glove box at -30 °C.
