Drastic influence of the anion nature and concentration on high pressure intrusion-extrusion of electrolyte solutions in Silicalite-1

A. Ryzhikov* H. Nouali, T. J. Daou and J. Patarin

Université de Strasbourg (UdS), Université de Haute Alsace (UHA), Axe Matériaux à Porosité Contrôlée (MPC), Institut de Science des Matériaux de Mulhouse (IS2M) UMR 7361, ENSCMu, 3 bis rue Alfred Werner, F-68093 Mulhouse, France.

Supporting Information

Figure S1. SEM micrographs of Silicalite-1 samples a) before intrusion, b) after three intrusion-extrusion cycles with saturated NaI solution.

Figure S2. N₂ adsorption−desorption isotherms at -196 °C of the Silicalite-1 samples before (degassed at 90° and 300°C) and after three intrusion-extrusion cycles with saturated (C₃_max) and diluted (C₃_max/2) NaI solutions.
Figure S3. $^{29}\text{Si}$–MAS NMR and $^1\text{H}$–$^{29}\text{Si}$ CPMAS spectra (insert) of MFI-type zeosil samples before (a) and after three intrusion-extrusion cycles with NaI (b) and NaClO$_4$ (c) saturated solutions.
