S1. Deprotonation free energy of 3:

Example-

$$\Delta G^* = 20.39 \text{ kcal/mol}$$

where solvation free energy of H^+ is taken 265.9 kcal/mol.^[1-3]

At pH 8.3 deprotonation free energy of 3 calculated as:^[4-5]

$$\Delta G = RT \ln \left(\frac{Q}{K_{eq}} \right)$$

where, R ($0.00198588 \times 10^{-3} \text{ kcal K}^{-1} \text{ mol}^{-1}$) is the universal gas constant, T is the temperature (298.15 K), Q is the reaction quotient and K_{eq} is the equilibrium constant at equilibrium

$$\Delta G^* = RT \ln K_{eq}$$

$$K_{eq} = e^{\left(-\frac{\Delta G^*}{RT} \right)} = e^{\left(-\frac{20.39 \text{ kcal mol}^{-1}}{0.00198588 \times 10^{-3} \text{ kcal K}^{-1} \text{ mol}^{-1} \times 298.15 \text{ K}} \right)}$$

$$= 1.10678 \times 10^{-15}$$

$$\Delta G = RT \ln \left(\frac{Q}{K_{eq}} \right) = (298.15 \text{ K} \times 1.9 \text{ kcal K}^{-1} \text{ mol}^{-1}) \times \ln \frac{10^{-8.3}}{1.10678 \times 10^{-15}}$$

$$\Delta G = 9.1 \text{ kcal mol}^{-1}$$

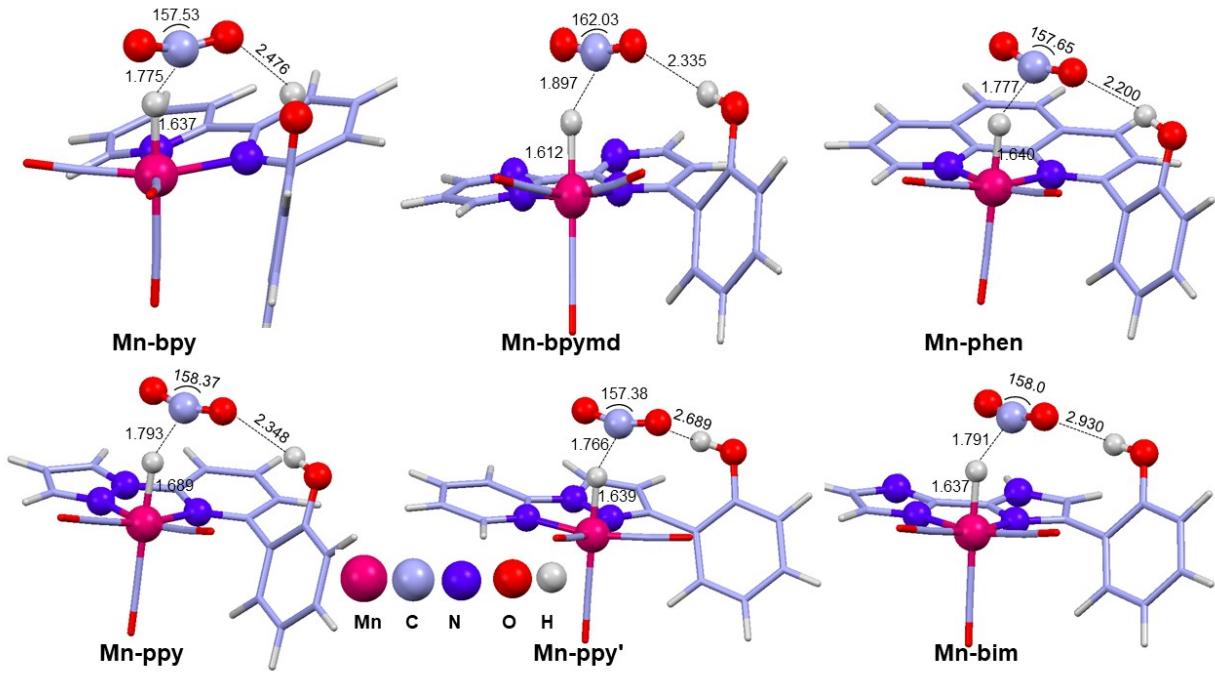

Figure S11. Optimized geometries of TS3 for all the Mn-complexes. Bond lengths are in Å.

S3. Relative reaction free energies for heterolytic H₂ cleavage and water splitting

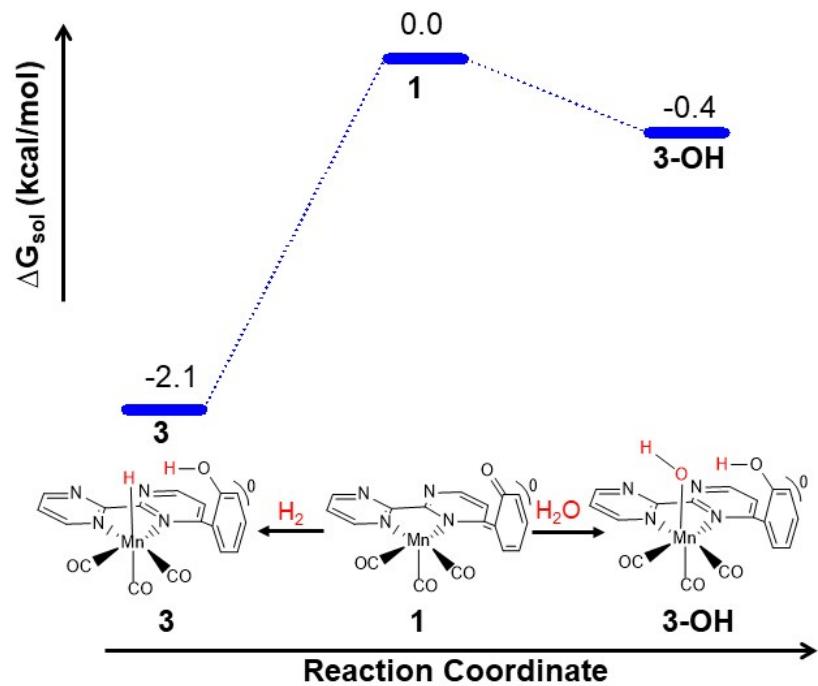

Figure S12. Relative reaction free energies for heterolytic H₂ cleavage and water splitting.

S4. Relaxed energy scan on the Mn-H and Mn-O bonds

We have investigated the relaxed energy scan for the desorption of formate from intermediate **5** (Figure S13). The relaxed energy scan suggests that the direct desorption of formate is favorable. Further, we find the reabsorbed of formate to more stable conformation **5'** (Figure S14) is a favourable process. Further, we have reabsorbed formate to a more stable conformation **5' and it** is also a favourable process (Figure S14). This agrees well with our calculated reaction free energy. In this process, we also find a new conformer **5''** (Figure S15), which is 0.79 kcal/mol less stable compared to **5'**.

Similarly, we have studied for **6** and **6'**. However, we are not able to optimize the intermediates related to formate desorption from **6**. However, the formate reabsorption is (**6**→**6'**) found to be a favourable process. In this process, we find another conformer **6''**, which is 0.71 kcal/mol less stable compared to **6'**. These results suggest the formation of **5' and 6'** are favourable and the total free energy barrier of the reaction depends upon the stability of **5'/ 6'**.
