Selective alkaline stripping of metal ions after solvent extraction by base-stable 1,2,3-triazolium ionic liquids

Stijn Raiguel, Daphne Depuydt, Tom Vander Hoogerstraete, Joice Thomas, Wim Dehaen and Koen Binnemans

Supplementary information
Synthetic section:

**p-Nitrophenyl azide**

p-Nitroaniline (28.1 g, 203 mmol) was suspended in a mixture of water (240 mL), 37% HCl solution (60 mL) and methanol (60 mL). This mixture was cooled to -5 °C, after which a solution of NaNO₂ (16.6 g in 40 mL of water) was added dropwise. This was allowed to stir for 40 min at -5 °C, causing a yellow precipitate to develop. Subsequently, a solution of NaN₃ (16.0 g in 40 mL of water) was added dropwise at – 5 °C. This was accompanied by the formation of nitrogen gas and precipitation of the product. The released gasses were washed in a NaOH solution of approximately 10 wt%. The solution was finally allowed to stir overnight at room temperature. To isolate the desired product, the mixture was extracted with two 200 mL portions of dichloromethane. After evaporation, the product was collected as a yellow powder in a yield of 90% (29.880 g).

\[ ^1H \text{ NMR (400 MHz, CDCl}_3, \delta/\text{ppm): 8.27 (d, 2H, J= 9.0 Hz, H in ortho to nitro), 7.16 (d, 2H, J = 9.0 Hz, H in ortho to azide).} \]

**5-Ethyl-1-(2-ethylhexyl)-4-methyl-1,2,3-triazole**

![Structure and allocations of hydrogen atoms in 5-ethyl-1-(2-ethylhexyl)-4-methyltriazole.](image)

A flask was charged with \( p \)-nitrophenyl azide (9.03 g, 55.0 mmol), 3-pentanone (8.11 mL, 76.8 mmol), 2-ethylhexylamine (12.58 mL, 76.80 mmol) and acetic acid (0.941 mL, 16.5 mmol). The mixture was stirred for 3 days at 65 °C in toluene (60 mL). After cooling, the mixture was washed with 10% NaH₂PO₄ (2x 100 mL) to remove the excess of 2-ethylhexylamine. The organic layer was then dried with MgSO₄ and solvents were evaporated off. Distilled water (65 mL) and 37% HCl solution (25 mL) were added and the mixture was cooled to -5 °C. A solution of NaNO₂ (4.50 g, 65.2 mmol) in water (11 mL) was added dropwise. The reaction mixture was allowed to stir at -5 °C for 1 h. The aqueous layer was diluted by the addition of 10% monobasic phosphate solution (100 mL) and separated off. The organic phase was washed with water (50 mL) and dried with MgSO₄. Solvents were evaporated, giving a brown oil in a yield of 70% (8.571 g).

\[ ^1H \text{ NMR (300 MHz, CDCl}_3, \delta/\text{ppm}): 4.07 \text{ ppm (d, 2H, J = 7.5 Hz, H1)}, 2.62 \text{ (q, 2H, J = 7.5 Hz, H9)}, 2.29 \text{ (s, 3H, H11)}, 1.91 \text{ (m, 1H, H2)}, 1.24 \text{ (m, 11H, H3+H5+H6+H7+H10)}, 0.89 \text{ (2t, 6H, H4+H8)}. \] Hydrogen allocations for the proton NMR spectrum are shown in Fig. S1. \[ ^{13}\text{C NMR (δ/ppm, 75 MHz, CDCl}_3): 140.01 \text{(sp}^2\text{-C)}, 134.41 \text{(sp}^2\text{-C)}, 51.63 \text{(N-CH)}_2, 40.05 \text{(CH)}, 30.42 \text{(CH}_3), 28.51 \text{(CH}_2), 23.69 \text{(CH}_2), 22.92 \text{(CH}_2), 16.08 \text{(CH}_3 \text{ or CH}_2), 14.01 \text{(2 CH}_3), 13.28 \text{(CH}_3 \text{ or CH}_2), 10.51 \text{(CH}_3), 10.48 \text{(CH}_3). \] FT-IR (ν/cm⁻¹): 2959, 2930, 2873 (sp³-C-H), 1596, 1527, 1459 (C=C and N=N stretch), 1342, 1241, 1108, 1046, 855, 754 (fingerprint region).
3,5-Diethyl-1-(2-ethylhexyl)-4-methyl-1,2,3-triazolium iodide

[T1][I]

Fig. S2: Structure and allocations of hydrogen atoms in 3,5-diethyl-1-(2-ethylhexyl)-4-methyltriazolium iodide.

5-Ethyl-1-(2-ethylhexyl)-4-methyltriazole (1.97 g, 8.81 mmol), iodoethane (2.42 mL, 26.4 mmol) and acetone (10 mL) were combined in a flask. The mixture was heated and stirred at 55 °C for 19 h. Acetone and the excess of iodoethane were evaporated under reduced pressure. The resulting liquid was washed with 5 mL of heptane at 100 °C to remove trace impurities. Phase separation was aided by cooling to -30 °C. The purified product was collected as a brown oil in a yield of 62% (2.056 g).

\[ ^1H \text{NMR (400 MHz, CDCl}_3, \delta/\text{ppm):} \]
\[ 4.66 (q, 2H, J = 7.0 Hz, H12), 4.35 \text{ ppm (d, 2H, J = 7.5 Hz, H1),} 2.95 \text{ ppm (s, 3H, H11), 2.03 (m, 1H, H2),} 1.68 (t, 3H, J = 7.0 Hz, H13), 1.34 (m, 11H, H3+H5+H6+H7+H10), 0.93 (2t, 6H, H4+H8). \]

Hydrogen allocations for the proton NMR spectrum are shown in Fig. S2. 

\[ ^13C \text{NMR (6/\text{ppm, 100 MHz, CDCl}_3):} \]
\[ 142.20 (\text{sp}^2 \text{-C}), 137.30 (\text{sp}^2 \text{-C}), 54.96 & 53.53 (\text{N-CH}_2), 47.71 (\text{N-CH}_2), 39.40 (\text{CH}), 30.97 & 30.16 (\text{CH}_2), 28.23 (\text{CH}_2), 23.56 (\text{CH}_2), 22.79 (\text{CH}_2), 17.29 (\text{CH}_2), 13.98 (\text{CH}_2), 13.79 (\text{CH}_2), 12.85 (\text{CH}_2), 10.33 (\text{CH}_3), 10.17 (\text{CH}_3). \]

FT-IR (v/cm\(^{-1}\)): 2959, 2929, 2872 (sp\(^3\)C-H), 1668, 1595, 1526, 1458 (C=C and N=N stretch), 1327, 1106, 854, 611 (fingerprint region). CHN calculated for C\(_{15}\)H\(_{30}\)IN: C 47.50%, H 7.97%, N 11.08; found: C 47.74, H 7.16, N 11.87.

3,5-dieethyl-1-(2-ethylhexyl)-4-methyltriazolium thiocyanate

[T1][SCN]

The triazolium salt [T1][I] (6.0 g, 16 mmol) was equilibrated twice with 25 mL of a 5 M solution of KSCN and washed with 100 mL of water. TXRF with an Yb standard gave an estimated iodide content of 9.93 g/L. This implies a residual iodide content of about 1 wt%.

1-(2-Ethylhexyl)-5-methyl-1,2,3-triazole

Fig. S3: Structure and allocations of hydrogen atoms in 1-(2-ethylhexyl)-5-methyltriazole.

A flask was charged with acetone (12.08 mL, 164.5 mmol), p-nitrophenyl azide (8.97 g, 54.7 mmol), 2-ethylhexylamine (12.58 mL, 76.8 mmol) and acetic acid (0.941 mL, 16.5 mmol). This mixture was heated to 55 °C and stirred for 18 h in toluene, using approximately 3 g of 4 Å molecular sieves. The mixture was washed with two 100 mL portions of 10% NaH\(_2\)PO\(_4\) solution. A solution of NaNO\(_2\) (4.48 g, 64.9 mmol) in water (9 mL) was added dropwise. The reaction mixture was allowed to stir at -5 °C for 40 min. The aqueous layer was separated off. The organic phase was washed with water (100 mL) and
dried with MgSO₄. Solvents were evaporated, yielding the product as a dark brown liquid. The product was obtained in a yield of 95% (10.298 g).

$^1$H NMR (300 MHz, CDCl₃, δ/ppm): 7.43 (s, 1H, H10), 4.12 (m, 2H, H1), 2.62 (s, 3H, H9), 1.90 (m, 1H, H2), 1.29 (m, 8H, H3+H5+H6+H7), 0.89 (m, 6H, H4+H8). Hydrogen allocations for the proton NMR spectrum are shown in Fig. S5. $^{13}$C NMR (δ/ppm, 75 MHz, CDCl₃): 132.75 (sp²-C), 132.52 (sp²-C), 51.21 (N-CH₂), 40.90 & 39.89 (CH), 30.40 (CH₂), 28.47 (CH₃), 23.67 (CH₂), 22.87 (CH₃), 13.97 (CH₃), 10.46 (CH₃), 8.56 (CH₃). FT-IR (ν/cm⁻¹): 3066 (sp²-C-H), 2959, 2929, 2860 (sp³-C-H), 1593, 1520, 1458 (C=C and N=N stretch), 1238, 1045, 752, 700 (fingerprint region).

3-Ethyl-1-(2-ethylhexyl)-4-methyl-1,2,3-triazolium iodide

[1H NMR (400 MHz, CDCl₃, δ/ppm): 9.47 (s, 1H, H10), 4.82 ppm (q, 2H, J = 7.5 Hz, H11), 4.38 (d, 2H, J = 7.0 Hz, H1), 2.66 (s, 3H, H9), 1.99 (m, 1H, H2), 1.71 (t, 3H, J = 7.0 Hz, H12), 1.34 (m, 8H, H3+H5+H6+H7), 0.93 (2t, 6H, H4+H8). Hydrogen allocations for the proton NMR spectrum are shown in Fig. S4. In some batches, a singlet at 2.63 ppm appears, believed to correspond to bound water molecules. $^{13}$C NMR: (δ/ppm, 75 MHz, CDCl₃): 140.04 (sp²-C), 130.17 (sp²-C), 54.77 (N-CH₂), 49.84 (N-CH₂), 40.99 & 39.38 (CH), 30.96 & 30.06 (CH₂), 28.18 (CH₂), 23.50 (CH₂), 22.75 (CH₃), 14.82 (CH₃), 13.93 (CH₃), 10.30 (CH₃), 10.10 (CH₃). FT-IR (ν/cm⁻¹): 3119 (sp²-C-H), 2959, 2930, 2861 (sp³-C-H), 1588, 1518, 1458 (C=C and N=N stretch), 1341, 1176, 1108, 853, 752 (fingerprint region). CHN calculated for C₁₃H₂₆IN₃: C 44.45%, H 7.46%, N 11.96%; found: C 47.73%, H 7.26%, N 11.28%.

3,5-Diethyl-1-(2-ethylhexyl)-4-methyl-1,2,3-triazolium thiocyanate

[1H NMR (300 MHz, CDCl₃, δ/ppm): 2.52 (s, 3H, H9), 2.21 (s, 3H, H10), 1.99 (m, 1H, H1), 1.71 (t, 3H, J = 7.0 Hz, H12), 1.34 (m, 8H, H3+H5+H6+H7), 0.93 (2t, 6H, H4+H8). Hydrogen allocations for the proton NMR spectrum are shown in Fig. S4. In some batches, a singlet at 2.63 ppm appears, believed to correspond to bound water molecules. $^{13}$C NMR: (δ/ppm, 75 MHz, CDCl₃): 119.34 (sp²-C), 130.74 (sp²-C), 49.84 (N-CH₂), 40.99 & 39.38 (CH), 30.96 & 30.06 (CH₂), 28.18 (CH₂), 23.50 (CH₂), 22.75 (CH₃), 14.82 (CH₃), 13.93 (CH₃), 10.30 (CH₃), 10.10 (CH₃). FT-IR (ν/cm⁻¹): 3066 (sp²-C-H), 2959, 2930, 2861 (sp³-C-H), 1588, 1518, 1458 (C=C and N=N stretch), 1341, 1176, 1108, 853, 752 (fingerprint region). CHN calculated for C₁₃H₂₆IN₃: C 44.45%, H 7.46%, N 11.96%; found: C 47.73%, H 7.26%, N 11.28%.

Some signals in $^{13}$C-NMR spectra are believed to correspond to identical carbon atoms, in separate conformers with slow interconversion.

Due to the relationship of the observed paths, their degeneracies were fixed as equal during fitting of the model, as were their absorption edge energies (8981 eV). The Debye-Waller factors were 53.8 and 55.8 for the first and last two paths, respectively. The low value of the absorption edge indicates that copper is present in the +1 oxidation state.¹

Raman spectroscopy of stripped [T2][I] samples

Samples of [T2][I] were equilibrated with 0.1 M CuCl$_2$ (1 mL aqueous phase and 150 mg ionic liquid) by shaking at 60 °C for 1 h at 2500 rpm. The aqueous phase was discarded and 1 mL of a reducing solution was added. Three solutions were evaluated: 0.1 M oxalic acid (a), 0.1 M sodium dithionite (Na$_2$S$_2$O$_4$, b) and 0.25 M Na$_2$S (c). The mixture was again shaken for equilibration. The aqueous phase was discarded and the ionic liquid was dissolved in 2 mL (samples a and b) or 4 mL (sample c) of DCM. Raman spectroscopy was performed on a Bruker RAMII FT-Raman module with the source operating at 100 mW. The spectra shown in Fig. S12 clearly show the absence of the characteristic vibrational band of the triiodide ion in samples b and c, located between 110 and 115 cm$^{-1}$, while this band was still present in sample a. Thus, both sulfide and dithionite are effective in the reduction of I$_3^-$ to I$^-$, while oxalic acid is ineffective. No precipitate of S$_8$ was present after reduction. It is therefore assumed that sulfur is oxidized to S(IV) as H$_2$SO$_3$. 
Fig. S16: Raman spectra of [T2][I] dissolved in DCM after treatment with oxalic acid (a), sodium dithionite (b) and sodium sulfide (c).
