**General considerations.** All manipulations, except syntheses of Pd(II) complexes, were carried out under open atmosphere. *N*-Substituted imidazoles were prepared by following literature procedures. All commercially available chemicals including aryl bromides and arylboronic acids were used as received (Sigma-Aldrich, Avra and Alfa Aesar). THF, toluene (from Na/benzophenone ketyl) acetonitrile and chloroform (from CaH₂) were distilled fresh as and when required. Thin-layer chromatography was performed using pre-coated silica gel 60 F₂₅₄ plates and UV light at 254 nm. ¹H, ¹³C and ³¹P spectra were recorded on a Bruker 400 MHz instrument. HR-MS were recorded on Agilent 6540 UHD Q-TOF mass spectrometer. Elemental analyses were performed using a Thermo Scientific Flash 2000 CHNS analyser.

**Experimental procedures**

**General procedure for the synthesis of *N*-(3-chloro-2-quinoxalinyl)-*N'*-aryl substituted imidazolium salts.** 2,3-Dichloroquinoxaline (1 equiv) and excess of *N*-aryl substituted imidazole (1.5 equiv) were taken in a pressure tube, closed tight and heated at 140 °C for 90 min. The mixture was allowed to cool to ambient temperature, diethyl ether was added and ultrasonicated for 30 min. The suspension was filtered, the solid residue was washed with diethyl ether and dried under high vacuum.

*N*-(3-Chloro-2-quinoxalinyl)-*N'*-(2,6-diisopropylphenyl)imidazolium chloride, [HL₁Cl]Cl.

2,3-Dichloroquinoxaline (0.995 g, 5.0 mmol), 1-(2,6-diisopropylphenyl)-1H-imidazole (1.712 g, 7.5 mmol). R¹ = 2,6-Diisopropylphenyl, [HL₁Cl]Cl

White solid. Yield: 92% (1.950 g). mp: 264 – 268 °C. ¹H NMR (400 MHz, DMSO-*d₆*): δ 10.80 (s, 1H, imidazole-NC₃H₃N), 8.81 (d, 1H, imidazole-NC₃H₃CHN), 8.64 (d, 1H, imidazole-NCH₃CHN), 8.19 (m, 4H, quino-H), 7.67 (m, 3H, Ph-H), 2.49 [m, 2H, CH(CH₃)₂], 1.29 [d, 12H, CH(CH₃)₂]

2-Chloro-3-(2-methyl-1H-imidazol-1-yl)quinoxaline.

2-Methylimidazole (0.412 g, 5.02 mmol), potassium hydroxide (0.338 g, 6.03 mmol), tetrabutylammonium bromide (0.023 g, 0.07 mmol) and 2,3-dichloroquinoxaline (1.000 g, 5.02 mmol) were placed in a round-bottomed flask and suspended in 20 mL of THF. The mixture was stirred at 70 °C for 2 h. The resulting mixture was allowed to cool to room temperature, and the solvent was removed under vacuum. Water was added to the residue and extracted three times with 100 mL of dichloromethane. After washing with water, the combined organic phases were dried over anhydrous MgSO_{4}, filtered, and volatiles
were removed under reduced pressure. The crude solid was purified by column chromatography (silica gel, hexane/ethyl acetate: 12/88) to afford white solid. Yield: 52% (0.632 g). mp: 149 - 153 °C. \(^{1}\)H NMR (400 MHz, CDCl\(_3\)): \(\delta 8.11\) (m, 2H, quino-H), 7.89 (m, 2H, quino-H), 7.24 (d, 1H, imidazole-NCHCN), 7.10 (d, 1H, imidazole-NCHCHN), 2.41 (s, 3H, imidazole-CH\(_3\)) ppm. \(^{13}\)C NMR (100 MHz, CDCl\(_3\)): \(\delta 146.05, 143.45, 142.85, 141.81, 139.96, 132.26, 132.13, 131.66, 129.46, 129.13, 128.98, 128.41, 120.05, 14.08\) ppm. Synthesis of cyclometalated NHC-phosphine-Pd(II) complexes.

A Schlenk tube (13 mm X 90 mm) was charged with zwitterionic Pd(II) complex (1 equiv) and DMAP (1.1 equiv) in acetonitrile (10 mL). The mixture was stirred under N$_2$ atmosphere for 10 min at room temperature. The volatiles were removed under vacuum, the residue was washed with 10 mL of 20% HCl and extracted with chloroform (3 X 10 mL). After drying the solution with Na$_2$SO$_4$, volatiles were removed under vacuum. Recrystallization of the residue from acetone gave colorless crystals of $\text{[Pd(L1)(PPh}_3\text{)Cl}_2\text{]}$ at 0 °C.

**General procedure for Suzuki-Miyaura cross-coupling reactions:** To a test tube (13 mm X 90 mm) with a stir bar were added arylboronic acid (1.2 mmol), K₂CO₃ (2.0 mmol), Pd catalyst (0.5 mol%), aryl bromide (1/n mmol, n = number of bromine atoms on aryl ring) and water (3 mL). The resulting mixture was stirred vigorously at room temperature or heated in an oil bath at 70 °C in open atmosphere. The progress of the reaction was monitored by TLC and \(^1\)H NMR spectroscopy. Most of the reactions were completed in 3 h. The reaction mixture was cooled to room temperature and mixed with water (5 mL). If the product was solid it was separated by simple
filtration using a frit and if the product was a semi-solid or an oily substance it was extracted with diethyl ether (3 X 10 mL). In the case of hydrophilic biaryl derivatives, 20 mL of 20% HCl was added to the reaction mixture and the product was either filtered or extracted with ethyl acetate (3 X 10 mL), the resulting organic portions were combined and dried over Na$_2$SO$_4$. The volatiles were removed using a rotary evaporator. The crude product was subjected to $^1$H NMR study. In case of impure products, purification was done by column chromatography (eluting with hexane/ethyl acetate) on silica gel (230-400 mesh). The identity of products was confirmed by NMR ($^1$H NMR) spectroscopy. Many biaryls have already been reported and the data was compared with the literature data.

**Hg poisoning test**

To a 13 X 90 mm test tube were added catalyst (0.5 mol%), a drop of Hg (>500 equiv per Pd atom) and water (3 mL). The mixture was stirred for 10 min at room temperature before the addition of phenylboronic acid (1.2 mmol), K$_2$CO$_3$ (2 mmol) and 4-bromoacetophenone (1.0 mmol). The reaction mixture was stirred vigorously at room temperature or heated in an oil bath at 70 °C for 3 h. The work up was done as per the procedure given for carrying out Suzuki-Miyaura cross-coupling reactions. The yield of the product (4-acetylbiphenyl) was determined by $^1$H NMR. The Hg was recovered and stored safely.

**PPh$_3$ poisoning test**

Triphenylphosphine (2 mmol, at t = 0 min) was taken along with the catalyst (0.5 mol%), K$_2$CO$_3$ (2 mmol) and the coupling reagents [phenylboronic acid (1.2 mmol) and 4-bromoacetophenone (1.0 mmol)] in water (3 mL). The reaction mixture was stirred vigorously at room temperature or heated in an oil bath at 70 °C for 3 h under open atmosphere. The work up was done as per the
procedure given for carrying out Suzuki-Miyaura cross-coupling reactions. The yield of the product (4-acetylbiphenyl) was analyzed by $^1$H NMR.

Two-phase test

A mixture of 4-bromoacetophenone (0.199 g, 1 mmol), phenylboronic acid (0.304 g, 2.5 mmol), catalyst I (0.5 mol%) and K$_2$CO$_3$ (0.552 g, 4 mmol) in water (3 mL) was magnetically stirred in the presence of freshly prepared immobilized aryl bromide$^2$ (0.200 g) at 70 °C for 3 h. The reaction mixture was cooled to room temperature and filtered through a G-4 frit. The residue was washed with 20 mL of water and then 20 mL of diethyl ether. The filtrate and the washings were collected together and mixed with water (10 mL). The resulting mixture was extracted with 20 mL of diethyl ether. The solvent from the organic extract was evaporated on a rotary evaporator and the white residue thus obtained was identified by $^1$H NMR. The residue collected on G-4 frit was hydrolyzed with KOH (1.68 g dissolved in 5 mL of water + 10 mL of EtOH) at 90 °C for 3 days. The reaction mixture was neutralized with aqueous HCl (20% v/v). The products were extracted with dichloromethane (30 mL), followed by ethyl acetate (40 mL). The organic extracts were combined together and the solvents were evaporated off under vacuum. The resulting residue was subjected to $^1$H NMR to identify the products.

Investigations into the nature of the catalysis (homogeneous vs heterogeneous)

There are several poison tests known in the literature to distinguish between homogeneous and heterogeneous catalysis. The most common method is the addition of mercury, which leads to amalgamation of the metal or adsorption on the metal surface of heterogeneous catalyst. There is another popular method in which a heterogeneous catalyst is poisoned by treating it with ligands like CS\(_2\), PPh\(_3\) or thiophene in substoichiometric amount (less than 1.0 equivalent per metal atom).\(^{35}\) The poisoning tests \(\text{viz}\) the addition of Hg and the addition of PPh\(_3\) were carried out on I and VI and the results are furnished in Table S2. Though the room temperature reactions were affected significantly, the reactions conducted at 70 °C afforded excellent yields in both the tests.
It is noteworthy that in case of PPh$_3$ poison test, even after the addition of 2 equivalents of PPh$_3$, the yields were almost quantitative, when the reaction was conducted at 70 °C.

Further, a two phase test, which is more confirmative in determining the nature of the catalysis (homogeneous vs heterogeneous), has also been performed on I. In this test, generally an immobilized aryl bromide, an aryl bromide and excess of arylboronic acid are used. If the catalyst is homogeneous, the immobilized aryl bromide will also be converted into product, which is not expected in case of a heterogeneous catalyst. A mixture of 4-bromoacetophenone and freshly prepared immobilized aryl bromide were treated with excess of phenylboronic acid in the presence of I as catalyst and K$_2$CO$_3$ in water at 70 ºC (Scheme S1). After 3 h of stirring, the mixture was filtered and the precipitate was extracted with ether, and analyzed with $^1$H NMR. The NMR spectrum showed that a 98% conversion of 4-bromoacetophenone occurred. The residue, which is basically the immobilized amide, was hydrolyzed and the resultant products were analyzed using $^1$H NMR after work up. The analysis with $^1$H NMR indicated that the immobilized aryl bromide
was also converted to the cross coupled product to the extent of 52%. These results indicate that the catalysis is largely homogeneous.
