**General procedures and materials:**

All manipulations of air-sensitive materials were performed with the rigorous exclusion of oxygen and moisture in flamed Schlenk-type glassware on a high-vacuum line (10⁻⁵ Torr), or in nitrogen-filled MBraun and Vacuum Atmospheres gloveboxes with a medium capacity recirculator (1–2 ppm oxygen). Argon and nitrogen were purified by passage through a MnO oxygen removal column and a Davison 4 Å molecular sieve column. Analytically pure solvents were dried and stored with Na/K alloy and degassed by three freeze–pump–thaw cycle prior to use (hexane, toluene, benzene-\textit{d}_6). The perimidin-2-iminato (PrRN where R = isopropyl) and Th(\textit{CH}_3)_2(Cp*)_2 were synthesized according to published literature procedures. Benzaldehyde, 2-pyridinylcarboxaldehyde, furfural, 2-thiophencarboxaldehyde, cyclohexylcarboxaldehyde, cyclo-pentylcarbaldehyde, isobutyraldehyde, and 1-naphthaldehyde (Sigma-Aldrich) were distilled over sodium bicarbonate and stored in a glovebox prior to use. 2-Naphthaldehyde, 2,3-naphthylbisaldehyde, phthalaldehyde (Sigma-Aldrich) were dried for 12 h on a high-vacuum line (10⁻⁵ Torr) and stored in a glovebox prior to use. NMR spectra were recorded on DPX200, Avance 300, and Avance 400 Bruker spectrometers. Chemical shifts for \textit{^1}H NMR and \textit{^13}C NMR are reported in ppm and referenced using residual proton or carbon signals of the deuterated solvent relative to tetramethylsilane.

MS experiments were performed at 200 °C (source temperature) in Maxis Impact (Bruker) mass spectrometer with an APCI solid probe method.

The single-crystal material was immersed in perfluoropolyalkylether and was quickly fished with a glass rod and mounted on a Kappa CCD diffractometer under a cold stream of nitrogen. Data collection was performed using monochromated Mo Kα radiation using \(\phi\) and \(\omega\) scans to cover the Ewald sphere. Accurate cell parameters were obtained with the amount of indicated reflections. The structure was solved by SHELXS-97 direct methods and refined by the SHELXL-97 program package. The atoms were refined anisotropically. Hydrogen atoms were included using the riding model. Figures were drawn (50 % probability thermal ellipsoids) using Diamond V3.1.
Synthesis of $\text{L}_2^\text{H}$ (5,7-diisopropyl-5,7-dihydro-6H-dibenzo[d,f][1,3]diazepin-6-imine):

Aqueous KOH (1.00 g, 17.82 mmol) was added to the diethyl ether (40 mL) suspension of $\text{L}_2^\text{H}\cdot\text{HBr}$ (2.50 g, 7.18 mmol) and the mixture were vigorously stirred for 30 min at ambient temperature. In a separatory funnel the two layers were separated and the aqueous layer was extracted with diethyl ether (3 × 30 mL). The combined organic phases were dried over anhydrous Na$_2$SO$_4$. After filtration, the solvent was removed in vacuo to afford an off-white solid. Yield: 1.75 g (90 %). $^1$H NMR (400 MHz, CDCl$_3$): δ = 7.43–7.41 (m, 2H, ArC$_\text{H}$), 7.29–7.18 (m, 6H, ArC$_\text{H}$), 4.04 (br, 2H, CHMe$_2$), 1.16 (d, $J = 8.0$ Hz, 6H, CHMe$_2$), 0.86 (d, $J = 4.0$ Hz, 6H, CHMe$_2$); $^{13}$C NMR (100 MHz, CDCl$_3$): δ = 166.5 (N$_\text{C}$N), 143.0 (ArC$_\text{H}$), 136.9 (ArC$_\text{H}$), 128.0 (ArC), 125.5 (ArC), 124.4 (ArC), 49.6 (CHMe$_2$), 23.6 (CHMe$_2$), 21.6 (CHMe$_2$) ppm.; ESI-MS, $m/z$: 293.18919, Anal. The pale yellow solution was stirred for 12 h at room temperature. Subsequent removal of the solvent and recrystallization from a concentrated toluene solution afforded 2 as colorless crystals. General Procedure for the Catalytic Tishchenko Reaction
A sealable J. Young NMR tube was loaded with 5.00 mg of complex 2 and 3 from a stock solution in C₆D₆ inside the glovebox. The respective aldehyde (100 equiv) was added, and the reaction was immediately diluted to 500 μL with C₆D₆. Solid aldehydes were dissolved in 300 μL of C₆D₆ before being added to the solution of the precatalyst. The progress of the reaction was monitored by ¹H NMR spectroscopy. After 24 h, the tube was opened to air, and the reaction was quenched with methanol. The products were identified by ¹H NMR spectroscopy and MS analysis, and the chemical shifts were compared with previously reported literature data.⁷
