Simple ZnEt₂ as catalyst in carbodiimide hydroalkynylation: structural and mechanistic studies

Antonio Martínez,ª Sonia Moreno-Blázquez,ª Antonio Rodríguez-Diéguez,b Alberto Ramos,ª Rafael Fernández-Galán,a Antonio Antiñolo*ª and Fernando Carrillo-Hermosilla*ª

Fernando.Carrillo@uclm.es

General Considerations. All reactions were performed using standard Schlenk and glove-box techniques under an atmosphere of dry nitrogen. Solvents were purified by passage through a column of activated alumina (Innovative Tech.) and degassed under nitrogen and stored over molecular sieves in the glove-box prior to use. Microanalyses were carried out with a Perkin-Elmer 2400 CHN analyzer. NMR spectra were recorded on a Varian FT-400 spectrometer using standard VARIAN-FT software. Mass spectroscopic analyses were performed on an Advion expression CMS instrument (electron impact). ZnEt₂ (1 M in hexane), ZnEt₂ (1.1 M in toluene), ZnMe₂ (2 M in toluene), alkynes, carbodiimides and isocyanates were purchased from Aldrich and used as received.

Procedure for hydroalkynylation reactions at NMR tube scale

Catalytic reactions were performed on a small scale in an NMR tube fitted with a concentric Teflon valve with 0.5 mmol of alkyne, 0.5 mmol of carbodiimide and the adequate amount of catalyst in the adequate solvent (toluene-d₈ preferentially) under nitrogen. Conversion of the starting material to product was determined by integration of the product resonances relative to the substrate peaks in the ¹H NMR spectrum. Compounds 2a-g were identified by comparing their NMR spectra with the literature data.¹
Preparative Scale Reaction for 2a. In the glovebox, phenylacetylene (3 mL, 27 mmol) and N,N'-diisopropylcarbodiimide (4.2 mL, 27 mmol) in toluene (10 mL) were added in a Schlenk tube. ZnEt$_2$ (0.8 mmol) was then added to the above reaction mixture. The Schlenk tube was taken outside the glovebox and the reaction was stirred at 70 ºC for the 24 h. Then, the solution was concentrated under reduced pressure, hexane was added and the mixture was placed in a refrigerator at -20 ºC for 16 h. After filtration the product was obtained as yellowish microcrystalline solid. The mother liquor was reconcentrated in vacuo and placed in a refrigerator at -20 ºC for 16 h to obtain a second crop of crystals. Total isolated yield 85%. New compound 2f was obtained in a similar way using 4-trifluormethoxyphenylacetylene as starting material, as a yellow solid, with an isolated yield of 88%.

2f, N,N'-diisopropyl-3-(4-(trifluoromethoxy)phenyl)propiolimidamide

General procedure for kinetic experiments

Kinetic experiments were performed using a Varian FT-400 MHz spectrometer. A standard solution 0.11M of catalyst 1 was made, obtained from a 1.1 M solution in toluene and diluted in deuterated toluene. The described kinetic experiments were carried out on the N,N'-disopropylcarbodiimide and phenylacetylene (or deuterated phenylacetylene) to form the corresponding propiolamidine 2a.

The reactions were carried out in J-Young NMR tubes and the reaction rates were measured by monitoring the disappearance of carbodiimide (or alkyne) relative to the internal standard tetrakis(trimethylsilyl)silane (6 mg) by 1H NMR spectroscopy at the described intervals over more than three half-lives. All data were processed using Varian integral analysis software. Reaction rates were derived by fitting data to zero, first or second order equations by using linear trend lines generated by Microsoft Excel software.
Figure S7. Effect of the initial amidine concentration on the kinetic behaviour. $[\text{DIC}]_0 = [\text{PhCCH}]_0 = 0.23\text{M}, [\text{amidine}]_0 = 0.12\text{ M}, [1] = 6.8.10^{-3}\text{M}.$

**Procedure for isocyanate insertion and hydroamination reactions at NMR tube scale**

Catalytic reactions were performed on a small scale in an NMR tube fitted with a concentric Teflon valve with 0.5 mmol of alkyne, 0.5 mmol of carbodiimide and ZnEt$_2$ (3% mol) in toluene-$d^8$ under nitrogen, at 70º C for 24h. Then 0.5 mmol of the corresponding isocyanate or isothiocyanate were added to the NMR tube inside the glovebox, and the mixture heated at 70º C for 24 h. Compounds 6a, d, g were identified by comparing their NMR spectra with the literature data.$^{1e}$

**6b,** $^1$H NMR (400 MHz, toluene-$d^8$) δ (ppm) 7.37-6.57 (m, C$_6$H$_5$), 5.36 (m, CH, Cy), 5.14 (m, CH, Cy), 4.58 - 1.06 (m, Cy). MS (ESI) (m/z): 428 (M$^+$+H$^+$).

**6c,** $^1$H NMR (400 MHz, toluene-$d^8$) δ (ppm) 7.02-6.74 (m, C$_6$H$_5$), 3.80 (q, CH$_2$, J = 7.1 Hz), 1.59 (s, tBu), 1.25 (t, CH$_3$, J = 7.1 Hz). MS (ESI) (m/z): 348 (M+H$^+$).
