Appendix I. Determination of initial rate equation of Al/Cac-poly(rU) at pH=5.0.

For Al/Cac-poly(rU) at pH=5.0 the hypothesized model is

\[
\frac{1}{K_2} \quad M_2L_2 \rightleftharpoons M_2L + L 
\]

(I.1)

\[
\frac{1}{K_1} \quad M_2L \rightleftharpoons 2M + L 
\]

(I.2)

\[
k_1 \quad 2M + P \rightarrow \text{products} 
\]

(I.3)

where M is the free metal, L the free ligand, P is the RNA monomeric unit, M_2L_2 and M_2L are the metal/ligand complexes. The apparent constants K_1 and K_2 of the metal/ligand complex at pH=5.0 are given by (I.4) and (I.5), with [M], [L], [M_2L] and [M_2L_2] the molar concentration of the free metal, the free ligand and the complexes at the equilibrium, respectively, whereas k_1 is the kinetic constant of the direct reaction.

\[
K_1 = \frac{[M_2L]}{[M]^2[L]} \quad \text{(I.4)}
\]

\[
K_2 = \frac{[M_2L_2]}{[M_2L][L]} \quad \text{(I.5)}
\]

The initial rate of the reaction is given by Equation (I.6)

\[
v_i = k_1 [M]^2[P] 
\]

(I.6)

Analytical concentration of the RNA (C_p) and metal (C_{AlCac}) are expressed by eqns (I.7) and (I.8)

\[
C_p = [P] + [\text{products}] \quad \text{(I.7)}
\]

\[
C_{AlCac} = [M] + 2[M_2L_2] + 2[M_2L] + [\text{products}] \quad \text{(I.8)}
\]

In the initial stage of the reaction, the concentration of the products is negligible with respect to the reactant concentrations. So, it can be excluded from (I.7) and (I.8). The reaction order with respect to L is n_L=-2, which indicates that large amounts of M_2L_2 are formed. Hence, C_{AlCac} \approx 2[M_2L_2]. In addition, as we work in excess of cacodylate, it follows that [L]=C_L.

From (I.4) and (I.5) one obtains (I.9)
\[
[M]^2 = \frac{C_{AlCac}}{2K_1K_2C_L^2}
\]  \hspace{1cm} (I.9)

and, then, equation (I.10) for the initial reaction rate, provided that reaction (I.1) and (I.2), are fast compared to reaction (I.3).

\[
v_i = \frac{k_1 C_{AlCac} C_P}{2K_1K_2 C_L^2}
\]  \hspace{1cm} (I.10)

**Appendix II. Determination of initial rate equation of Al/Cac-poly(rA) and Al/Cac-poly(rU) at pH=7.0.**

For Al/Cac-poly(rU) and Al/Cac-poly(rA) at pH=7.0 the hypothesized model is

\[
\frac{1}{K'_2} \hspace{1cm} M_2L_2 \rightleftharpoons M_2L + L
\]  \hspace{1cm} (II.1)

\[
2M_2L + P \rightarrow \text{products}
\]  \hspace{1cm} (II.2)

where \(L\) is the free ligand, \(P\) is the RNA monomeric unit, \(M_2L_2\) and \(M_2L\) are the metal/ligand complexes. The apparent equilibrium constant \(K'_2\) of the metal/ligand complex at pH=7.0 is given by (II.3) with \([L]\), \([M_2L_2]\) and \([M_2L]\) the molar concentration of the free ligands and the complexes at the equilibrium, respectively, whereas \(k_2\) and \(k'_2\) are the kinetic constants of the forward reaction for the Al/Cac-poly(rA) and Al/Cac-poly(rU) systems, respectively.

\[
K'_2 = \frac{[M_2L_2]}{[M_2L][L]}
\]  \hspace{1cm} (II.3)

The initial rate of the reaction is:

\[
v_i = k_2[M_2L]^2[P]
\]  \hspace{1cm} (II.4)

Analytical concentration of the RNA \((C_P)\) and metal \((C_{AlCac})\) are expressed by Equations (II.5) and (II.6)

\[
C_P = [P] + [\text{products}]
\]  \hspace{1cm} (II.5)

\[
C_{AlCac} = 2[M_2L] + 2[M_2L_2] + [\text{products}]
\]  \hspace{1cm} (II.6)
For the reasons given in Appendix I it turns out that for this system as well \( C_{\text{AlCac}} = 2[M_2L_2] \) and \([L] = C_L\).

Rearranging (II.3) one obtains (II.7)

\[
[M_2L]^2 = \frac{C_{\text{AlCac}}^2}{4K_2^\ast C_L^2}
\]  

(II.7)

Which, introduced in (II.4), yields the expression (II.8) for the initial reaction rate.

\[
v_i = \frac{k_2 C_{\text{AlCac}}^2 C_P}{4K_2^\ast C_L^2}
\]

(II.8)

**Appendix III. Determination of initial rate equation Al/Cac-[poly(rA)], at pH=5.0.**

For Al/Cac-[poly(rA)], at pH=5.0 the proposed model is

\[
\begin{align*}
\frac{1}{K_2} & : \quad M_2L_2 \rightleftharpoons M_2L + L \\
& : \quad M_2L + P \rightarrow \text{products}
\end{align*}
\]

(III.1) 

(III.2)

where \( L \) is the free ligand, \( P \) is the RNA monomeric unit, \( M_2L \) and \( M_2L_2 \) are the metal/ligand complexes. The apparent constant \( K_2 \) of the metal/ligand complex is given by (III.3), being \([L]\), \([M_2L]\) and \([M_2L_2]\) the molar concentration of the free ligand and of the metal/ligand complexes at the equilibrium, respectively, whereas \( k_3 \) is the kinetic constant of the direct reaction.

\[
K_2 = \frac{[M_2L_2]}{[M_2L][L]}
\]

(III.3)

The initial rate of the slow reaction is:

\[
v_i = k_3[M_2L][P]
\]

(III.4)

Analytical concentration of the RNA (\( C_P \)) and metal (\( C_{\text{AlCac}} \)) are expressed by Equation (III.5) and (III.6)
\[ C_P = [P] + [\text{products}] \quad \text{(III.5)} \]
\[ C_{AlCac} = 2[M_2L] + 2[M_2L_2] + [\text{products}] \quad \text{(III.6)} \]

For the reasons given in Appendix I, it follows that \( C_{AlCac} \approx 2[M_2L] \) and \( [L] \approx C_L \).

From (III.3) one obtains (III.7)

\[
[M_2L] = \frac{C_{AlCac}}{2 K_2 C_L} \quad \text{(III.7)}
\]

which, introduced in (III.4), yields the initial reaction rate (III.8)

\[
v_i = \frac{k_3 C_{AlCac} C_P}{2 K_2 C_L} \quad \text{(III.8)}
\]
