## Experimental section

All chemicals and solvents were purchased from common commercial sources and were used as received without any further purification. All reactions were monitored by TLC on silica Merck $60 \mathrm{~F}_{254}$ pre-coated aluminum plates Proton nuclear magnetic resonance ( ${ }^{1} \mathrm{H}$ NMR) spectra were recorded on a Brüker spectrometer at 300 MHz . Chemical shifts are reported in $\delta$ units ( ppm ) with TMS as reference ( $\delta \mathrm{o} .00$ ). All coupling constants (J) are reported in Hertz. Multiplicity is indicated by one or more of the following: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet). Carbon nuclear magnetic resonance ( ${ }^{13} \mathrm{C}$ NMR) spectra were recorded on a Brüker at 75 MHz . Chemical shifts are reported in $\delta$ units (ppm) relative to $\mathrm{CDCl}_{3}(\delta 77.0)$. MW-assisted reactions were performed on a Synthos 3000 instrument from Anton Paar, equipped with a $4 \times 24 \mathrm{MG} 5$ Rotor and an IR probe used for external temperature control.

LC-MS analysis were carried using an Agilent 6540 UHD Accurate Mass O-TOF LC-MS (Agilent, Santa Clara, CA) fitted with a electrospray ionisation source (Dual AJS ESI) operating in positive ion mode. Chromatographic separation was achieved using a C18 RP analytical column (Poroshell 120, SB-C18, $50 \times 2.1 \mathrm{~mm}, 2.7 \mu \mathrm{~m}$ ) at $30^{\circ} \mathrm{C}$ with a elution gradient from $5 \%$ to $95 \%$ of B over 13 min, A being $\mathrm{H}_{2} \mathrm{O}$ ( $0.1 \% \mathrm{FA}$ ) and $\mathrm{B} \mathrm{CH}_{3} \mathrm{CN}(0.1 \% \mathrm{FA})$. Flow rate was $0.4 \mathrm{ml} / \mathrm{min}$.

## General MW-assisted protocol for synthesis of trans- 4,5 diaminocyclopent-2-enones (1a10a).

To a water solution ( 3 mL ) of furfural ( 1 mmol ) in a 3 mL glass vial, the amine ( 2.2 mmol ) was added. The mixture was reacted for 5 min in a Synthos 3000 microwave instrument, fixed on the temperature value of $60^{\circ} \mathrm{C}$ (IR Limit). The reaction was monitored by TLC and GC/MS analysis. Diethyl ether was added after the completion of reaction and the products were isolated after evaporation of the solvent to yield compounds 1a-10a in 80-93 \% yields.

General protocol for the synthesis of $\mathbf{2 , 4}$ diaminocyclopent-2-enones ( $\mathbf{1 b} \mathbf{b} \mathbf{3 b}$ ) and ( $\mathbf{1 c} \mathrm{c} \mathbf{1} \mathbf{j}$ ).

To a water solution ( 3 mL ) of furfural ( 1 mmol ) in a 3 mL glass vial, the amine ( 2.2 mmol ) was added. The mixture was reacted for 5 min in a Synthos 3000 microwave instrument, fixed on the temperature value of $60^{\circ} \mathrm{C}$ (IR Limit).

In order to obtain the 2,4 bisubstituted cyclopentenones $\mathbf{1 b} \mathbf{- 3 b}$ the reaction mixture, after MW irradiation, was kept at room temperature for further 4 hour. After completion, diethyl ether was added ( $3 \times 2 \mathrm{~mL}$ ) and the organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered. The products were isolated after evaporation of the diethyl ether to afford compounds $\mathbf{1 b} \mathbf{b} \mathbf{- 3}$ b in $85-91 \%$ yields.

Instead, for the synthesis of compounds $\mathbf{1 c - 1 j}$, after MW irradiation, the addition of various nucleophiles ( 1 mmol ) was necessary. Also in this case the mixture was maintained at room temperature for further 4 hours. The reaction was monitored by TLC and GC/MS analysis. After completion, water was removed under reduced pressure and the resulting crude product was purified by flash chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 9.5: 0.5\right)$. The products $\mathbf{1 c} \mathbf{c} \mathbf{1} \mathbf{j}$ were obtained in $79-$ 89 \% yields.
