1. General Information.

10% Pd/C was supplied by the N. E. Chemcat Corporation (Tokyo, Japan). H$_2$O, THF and toluene as solvents were purchased from a commercial source and used without further purification. Flash column chromatography was performed with Silica Gel 60 N (Kanto Chemical Co., Inc., 63–210 µm spherical, neutral). $^1$H and $^{13}$C NMR spectra were recorded on a ECA 500 spectrometer at room temperature in CDCl$_3$ as a solvent and internal standard ($^1$H NMR: $\delta$= 7.26; $^{13}$C NMR: $\delta$= 77.0 for CDCl$_3$, $^1$H NMR: $\delta$= 2.49; $^{13}$C NMR: $\delta$= 39.5 for DMSO-$d_6$) with tetramethylsilane as an internal standard. IR spectra were recorded by a Brucker FT-IR ALPHA. The Pd leaching was analysed by ICP-OES using SPS5520 (SII Nano
Technology, Tokyo, Japan). ESI high resolution mass spectra (HRMS) were measured by a Shimadzu hybrid IT-TOF mass spectrometer. Melting points were measured by a SANSYO SMP-300 melting point apparatus.

2. Preparation of substrates.
2-1. Synthesis of 1,3-dienes (1)
2-1-1. General procedure A

To a suspension of methyltriphenylphosphonium bromide (6.0 mmol) in THF (30 mL) was added n-BuLi (2.3 mL: 2.6 M in n-hexane, 3.6 mmol) at 0 °C under argon. After stirring for 15 min, a cinnamaldehyde derivative (6.0 mmol) was added. The reaction mixture was warmed to room temperature and the progress of the reaction was monitored by TLC. After the reaction was completed, the reaction mixture was quenched with sat. NH₄Cl aq. (10 mL) and extracted with EtOAc (10 mL × 2). The combined organic layers were dried over MgSO₄, and concentrated in vacuo. The residue was purified by silica-gel column chromatography to give the corresponding 1-aryl-1,3-butadiene derivative (1).

6. Metal leaching test.

To a solution of dimethyl 3-phenylcyclohexa-1,4-diene-1,2-dicarboxylate (3a: 1.4 g, 5.0 mmol) in H\(_2\)O (50 mL) were added 10% Pd/C (266 mg, 0.25 mmol), acrylic acid (4.5 mL, 50 mmol) under argon. The reaction mixture was refluxed at 120 °C for 6 h. After stirring for 6 h, the reaction mixture was cooled to room temperature. The reaction mixture was passed through a filter paper [Kiriyama, No. 5C (1 µm), diameter = 40 mm] and the catalyst was washed with H\(_2\)O (20 mL × 5) and AcOEt (20 mL × 5). The filtrate was extracted with AcOEt (20 mL × 2). The combined organic layers were washed sat. NaHCO\(_3\) aq. (20 mL × 2), dried over MgSO\(_4\), and concentrated in vacuo. The residue was dissolved in EtOAc, and the aqueous layer was diluted with H\(_2\)O to 100 mL, respectively. The Pd leaching in each layers was measured by ICP-OES. A very small amount of residual Pd species was detected in aqueous layer (4.0 ppm), while no palladium was detected in organic layer.

7. Reuse test.

To a test tube were added dimethyl 3-phenylcyclohexa-1,4-diene-1,2-dicarboxylate (3a: 27.2 mg, 0.1 mmol), 10% Pd/C (5.3 mg, 0.005 mmol), acrylic acid (34.3 µL, 0.5 mmol), and H\(_2\)O (1 mL), then the system was sealed with a septum. The air inside was replaced with argon (balloon) by three vacuum/argon cycles. The test tube was placed on an organic reactor, ChemiStation (EYELA, Tokyo Rikakikai Co., Ltd., Tokyo, Japan), and the mixture was
refluxed (80 ºC outer temperature). After 6 h, the reaction mixture was cooled to room temperature. The reaction mixture was passed through a filter paper [Kiriyama, No. 5C (1 µm), diameter = 40 mm] and the catalyst was washed with H₂O (10 mL × 5) and MeOH (10 mL × 5). The filtrate was extracted with EtOAc (20 mL × 2). The combined organic layers were washed sat. NaHCO₃ aq. (20 mL × 2), dried over MgSO₄, and concentrated in vacuo. The filtrated catalysts were further washed with MeOH (50 mL) and water (50 mL) and dried in a desiccator under vacuum overnight, then the recovered catalyst was used for the next run. The results of reuse test are summarized in the Table S4.

8-1. GC/TCD analysis (eq. 2)

To a solution of dimethyl 3-phenylcyclohexa-1,4-diene-1,2-dicarboxylate (3a: 0.27 g, 1.0 mmol) in H₂O (10 mL) was added 10% Pd/C (53.3 mg, 0.05 mmol) under argon. The reaction mixture was refluxed at 80 ºC. After stirring for 6 h, the reaction mixture was cooled to room temperature. The inside gasses were analyzed by GC/TCD and H₂ gas was detected. The reaction mixture was passed through a membrane filter (Millipore, Millex-LH, 0.20 mm) to remove Pd/C. The filtrate was extracted with EtOAc (10 mL × 3). The combined organic layers
were washed sat. NaHCO₃ aq. (10 mL × 3), dried over MgSO₄ and concentrated in vacuo. The residue was purified by silica-gel column chromatography using n-hexane-EtOAc (5/1) as a mixed eluent to give the mixture (0.27 g) of biphenyl-2,3-dicarboxylic acid dimethyl ester (4a: 0.69 mmol, 69% yield) and dimethyl 3-phenylcyclohexa-1,2-dicarboxylate (5a: 0.30 mmol, 30% yield).

### 3-2. Tracer test of acrylic acid derivatives (eq. 3)

To a solution of dimethyl 3-phenylcyclohexa-1,4-diene-1,2-dicarboxylate (3a: 27.2 mg, 0.1 mmol) in H₂O (1 mL) was added 10% Pd/C (5.3 mg, 0.005 mmol) and dodecyl acrylate (6: 112.2 mg, 0.5 mmol) as a H₂ acceptor under argon. The reaction mixture was refluxed at 120 °C. After stirring for 6 h, the reaction mixture was cooled to room temperature and passed through a membrane filter (Millipore, Millex-LH, 0.20 mm) to remove Pd/C. The filtrate was extracted with EtOAc (10 mL × 3). The combined organic layers were washed sat. NaHCO₃ aq. (10 mL × 3), dried over MgSO₄ and concentrated in vacuo. The residue was purified by silica-gel column chromatography using n-hexane-EtOAc (20/1) as a mixed eluent to give biphenyl-2,3-dicarboxylic acid dimethyl ester (4a: 25.6 mg, 0.095 mmol, 95% yield) and the mixture of dodecyl acrylate (6: 0.414 mmol) and dodecyl propionate (7: 0.077 mmol).

3-3. Consideration of stereochemistry (3’c-[cis] and 3’c-[trans]: eq. 5)

To a solution of dimethyl 3-phenylcyclohexene-4,5-cis-dicarboxylate (3’c: 27.4 mg, 0.1 mmol) in H₂O (1 mL) was added 10% Pd/C (10.6 mg, 0.01 mmol, 10 mol%) and acrylic acid (68.6 µL, 1.0 mmol) under argon. The reaction mixture was refluxed at 120 °C. After stirring for 24 h, the reaction mixture was cooled to room temperature and passed through a membrane filter (Millipore, Millex-LH, 0.20 mm) to remove Pd/C. The filtrate was extracted with EtOAc (10 mL × 3). The combined organic layers were washed sat. NaHCO₃ aq. (10 mL × 3), dried over MgSO₄ and concentrated in vacuo. The residue was purified by silica-gel column chromatography using n-hexane-EtOAc (5/1) as a mixed eluent to give the mixture of biphenyl-2,3-dicarboxylic acid dimethyl ester (4a: 0.044 mmol, 44% yield) and the recovered dimethyl 3-phenylcyclohexene-4,5-cis-dicarboxylate (3’c-[cis]: 0.048 mmol, 48% yield).
