1. General experimental procedures:
All glass apparatus were oven-dried prior to use. HRESIMS spectra were obtained using a Thermo Fisher LTQ-orbitrap instrument. $^1$H NMR and $^{13}$C NMR spectra were recorded using a Bruker spectrometer (operating at 400 MHz for $^1$H NMR; 100 MHz, for $^{13}$C NMR, respectively; or 600 MHz for $^1$H; 150 MHz for $^{13}$C, respectively) using CDCl$_3$ as solvent. Tetramethylsilane ($\delta$ 0.00 ppm) served as an internal standard in $^1$H NMR and $^{13}$C NMR unless stated otherwise. Chemical shift ($\delta$ 0.00 ppm) values are reported in parts per million and coupling constants in Hertz (Hz). Splitting patterns are described as singlet (s), doublet (d), triplet (t), quartet (q) and multiplet (m). Reactions were monitored by TLC (GF254 nm). TLC plates were visualized in UV light (254 nm) and by staining with spray reagent, vanillin or iodine. Flash column chromatography was performed with silica gel (Qingdao Haiyang Chemical Co., Ltd, 200-300 mesh). Andrographolide was purchased from Guanghan Bencao Company. Other chemicals and reagents were obtained from Sigma-Aldrich (USA) or Chengdu Best-Reagent in reagent grade and were used without further purification.

2. Synthesis of compound a
Andrographolide (4 g) was dissolved in 100 ml acetone, then 13 ml 2,2-dimethoxypropane was added in one portion. The mixture was stirred for 5 minutes,
then 0.14 g pyridinium p-toluenesulfonate was added, the resulting mixture was stirred in room temperature for 2 hours. After the reaction, the solvent was removed under vacuum, the residue was dissolved in 80 ml CH₂Cl₂, washed with 50 ml sodium hydrogen carbonate solution, 50 ml H₂O, 50 ml saturated NaCl solution, respectively. The organic layer was dried with anhydrous Na₂SO₄ and evaporated to dryness under vacuum, the residue was purified by chromatography using ethyl acetate-hexane (3:7) to give a as a white solid (4.3 g, 94%). ³¹H NMR (400 MHz, CDCl₃), δ 6.98 (t, J=8.00Hz, 1H), 5.04 (d, J=4.00Hz, 1H), 4.92(s, 1H), 4.62 (s, 1H), 4.45-4.44 (q, d, J=4.00Hz,1H), 4.28 (d, J=10.00Hz,1H), 3.95 (d, J=10.00Hz, 1H), 3.50 (dd, J₁=4.00Hz, J₂=8.00Hz, 1H), 3.18 (d, J=10.00Hz, 1H), 2.57-2.55(m, 3H), 2.43 (d,J=12.00Hz,1H), 2.00-1.91(m, 2H), 1.81-1.77 (m,6H), 1.42 (s,3H), 1.37 (s,3H), 1.25 (s,3H), 0.97 (s,3H).

3. Synthesis of 2-(tosyloxy)acetic acid

Ethyl 2-hydroxyacetate (5 g) and 4-methylbenzenesulfonyl chloride (9.2 g) were added in anhydrous ether (40 ml). The solution was cooled to 0 °C, and triethylamine (13.4 ml) was then added dropwise. The mixture was stirred at 0 °C for 2 hours. After the reaction, the solution was washed with water (40 ml×2), saturated NaCl solution (40 ml). The organic layer was dried with anhydrous Na₂SO₄ and evaporated to dryness under vacuum, the residue was purified by chromatography using ethyl acetate-hexane (1:5) to afford a white solid (9.3 g). The solid was added into a mixed solution of ethanol (20 ml) and 5 % sodium hydroxide (16 ml ), and stirred at 20 °C for 5 hours. After the reaction, the solution was distilled under vacuum until no
ethanol, the residue was added to 100 ml ice-water, then the pH was adjusted to 2, the white precipitate was filtered, and crystallized to afforded the 2-(tosyloxy)acetic acid as a white solid (7.6 g, 69%). $^1$H NMR (400MHz, CDCl$_3$) δ 7.84 (d, J=8.00Hz, 2H), 7.37(d, J=8.00Hz, 2H), 4.64 (s, 2H), 2.46 (s, 3H).

4. Synthesis of compound b

2-(tosyloxy)acetic acid (1.7 g) and sulfurous dichloride (6 ml) were added to 50 ml flask, refluxed under N$_2$ for 2 h. After that, the excessive sulfurous dichloride was distilled under vacuum, and then the residue was dissolved in anhydrous CH$_2$Cl$_2$ (15 ml). In another flask, a (1.8 g), triethylamine (1.2 ml), and anhydrous CH$_2$Cl$_2$ (20 ml) were added, stirred, and then cooled to 0 °C. After that, the former prepared acyl chloride was added dropwise, and then stirred at room temperature for 1 h. After the reaction, the mixture was washed with water (50 ml), saturated NaCl solution (50 ml), then the organic layer was dried with anhydrous Na$_2$SO$_4$, and evaporated to give the crude oil, which was subjected to chromatography to afford compound b as an oil. (2 g, 73%).

5. General procedure for the synthesis of compound 1-9

To a flask was added the aromatic (or heteroaromatic) thiol, sodium methanolate, methanol, stirred for 20 min, then the mixture was cooled to 0 °C. Then a solution of b in acetone was added into the mixture dropwise, the result solution was stirred at room temperature for 1 hour, and then heated and refluxed for 15 min. After the reaction, the organic solvents were removed under vacuum, and the residue was dissolved in CH$_2$Cl$_2$, washed with H$_2$O, saturated NaCl solution. The separated
organic layer was dried with anhydrous Na$_2$SO$_4$ and evaporated to give the crude product. The crude product was then purified by column chromatography to afford compound 1-9.

7. synthesis of 2-((4-methylphenyl)thio)acetic acid

To a 50 ml flask was added 4-methylbenzenethiol (0.7 g), sodium methanolate (0.3 g), methanol (15 ml), the mixture was stirred at room temperature for 20 min, then the resulting solution was cooled to 0°C. A solution of ethyl 2-(tosyloxy)acetate (1.5 g) in methanol (10 ml) was added dropwise into the mixture, after that, the solution was stirred at room temperature for 1 hour, then refluxed for 15 min. After the reaction, the solvent was removed under the vacuum, and then CH$_2$Cl$_2$ (60 ml) was added to resolve the residue, the solution was washed by H$_2$O (60 ml) and saturated NaCl solution (60 ml), respectively. The organic layer was dried with anhydrous Na$_2$SO$_4$,
then evaporated to afford a brown oil. The oil was added to ethanol (10 ml) and 5% NaOH (8 ml), then reacted at 40°C for 1 h. After the reaction, the ethanol was distilled under vacuum, then water (100 ml) was added to the residue, the pH was adjusted to 1. The precipitated solid was filtered and purified by column chromatography to give a white solid (0.8 g, 75%). The corresponding substituted acetic acid and sulfurous dichloride were added to a dry flask, and refluxed under N$_2$ for 2 h. After that, the excessive sulfurous dichloride was distilled under vacuum, and then the residue was dissolved in anhydrous CH$_2$Cl$_2$. In another flask, a, triethylamine, and anhydrous CH$_2$Cl$_2$ were added, stirred, and then cooled to 0 °C. After that, the former prepared acyl chloride was added dropwise, and then stirred at room temperature for 1 h. After the reaction, the mixture was washed by H$_2$O, saturated NaCl solution, successively. The organic layer was dried with anhydrous Na$_2$SO$_4$ and evaporated to get the crude product, which was purified by column chromatography to afford the product.

11. General procedure for the synthesis of compound 33-38

The corresponding compound (27-32) and 70% acetic acid were added in the flask, and stirred for 45 min. After the reaction, H2O was added, then the pH was adjusted to 7 by using sodium hydrogen carbonate. The mixture was extracted with CH2Cl2 for three times. The organic layers were combined, and dried with anhydrous Na2SO4, then evaporated to give the crude product, which was subject to chromatography to afford the product.

12. MTT assay: Cancer cells were cultured in RPMI-1640 (GIBCO) medium with 10% fetal bovine serum (GIBCO) at 5% CO$_2$ and 37 °C. 100 µl cells were planted in 96-well plate at 3×10$^4$ cells/ml concentration. Proper concentration of compounds were prepared previously and added to each well (four times repeat wells for each concentration of compounds) while refresh the culture medium (volume racial of the culture medium vs. compound was 90 µl:10 µl) in the next day. 48 hours later,
refreshing the culture liquid with 90 µl RPMI-1640 medium and 10 µl 5 mg/ml MTT to avoid the interference from compounds and serum. Incubate the plates at former conditions for four hours, then carefully remove medium and add 150 µl DMSO into each well to dissolve crystals at room temperature for 10 minutes. Finally transfer the 96-well plates to the reader and measure absorbance at 490nm. IC<sub>50</sub> value was calculated by GraphPad Prism 5 software.
