1 Additional experimental data

1.1 Experimental techniques

A Mettler heating stage (FP 82 HT) was used for polarizing optical microscopy (POM, Optiphot 2, Nikon) and DSC traces were recorded with a DSC 200 F3 Maia calorimeter (NETZSCH) at 2 K min$^{-1}$. Fluorescence spectra were recorded using a Hitachi F-7000 fluorescence spectrometer (Hitachi, Japan). SEM experiments were carried out on a QUNT200 scanning electron microscopy (SEM, USA). All pictures were taken digitally. For the sample preparation, the gel was placed on a aluminum foil paper for some time until the gel become dry gel, then the sample was gold plated, finally the sample was put the sample into the scanning electron microscopy for observation.

Small-angle X-ray scattering (SAXS) experiments were performed in transmission mode with synchrotron radiation at the 1W2A SAXS beamline at Beijing Accelerator Laboratory and beamline BL16B1 Shanghai Synchrotron Radiation Facility. A modified Linkam hot stage with a thermal stability within 0.2 °C was used, with a hole for the capillary drilled through the silver heating block and mica windows attached to it on each side. Samples were held in the poly(imide) (Kapton) film. A MarCCD 165 detector was used. $q$ calibration and linearization were verified using several orders of layer reflections from silver behemate. Positions and intensities of the diffraction peaks were measured using PeakSolve$^{TM}$ (Galactic).

\(a\) The number of molecules in a 3D unit cell was calculated from the volume of this unit cell \((V_{\text{cell}})\) and the volume of a molecule \((V_{\text{mol}})\) calculated using crystal volume increments\(^{[S1]}\) according to \(n_{\text{cell}} = V_{\text{cell}}/V_{\text{mol}}\). \(V_{\text{cell}} = a_{\text{cub}}^3\) was as collated in Table S1. The values \(n_{\text{cell}}\) (average)
were obtained as the average of the $n_{\text{cell, crys}}$ and $n_{\text{cell, liq}}$. In order to verify the feasibility of these values, we measured the density of compounds $\text{IE}^3/14$ and $\text{IIIE}^m/n$ with the floating equilibrium method at room temperature ($\text{IE}^3/14$: $\rho = 0.960 \, \text{g cm}^{-3}$; $\text{IIIE}^8/10$: $\rho = 1.002 \, \text{g cm}^{-3}$; $\text{IIIE}^8/12$: $\rho = 0.985 \, \text{g cm}^{-3}$; $\text{IIIE}^9/14$: $\rho = 0.972 \, \text{g cm}^{-3}$). The values $n_{\text{cell}}(\rho)$ were obtained according to the formula $n_{\text{cell}}(\rho) = a^3 \rho N_A/M$ ($M =$ molecular mass, $N_A =$ the Avagadro constant, $\rho =$ the density). We find that the values $n_{\text{cell}}$ obtained from average packing coefficient and $n_{\text{cell}}(\rho)$ obtained from the measured density are very close. This indicates that the obtained values $n_{\text{cell}}(\text{average})$ are reliable, especially considering that the density at higher temperature should be a bit lower and in this way $n_{\text{cell}}(\rho)$ becomes smaller and approaches even closer to $n_{\text{cell}}(\text{average})$.

2 Synthesis and analytical data

2.1 General remarks

All reagents, unless otherwise specified, were obtained from Energy Chemical Company and used as received. $^1$H NMR and $^{13}$C NMR spectra were recorded on a Bruker–DRX-400 spectrometer and Bruker–DRX-500 spectrometer. Column chromatography was performed with merck silica gel 60 (230-400 mesh). The intermediates were purified by column chromatography, their structures were confirmed by $^1$H NMR and the purity was checked by TLC. Full analytic characterization was provided for all final compounds. The alkoxybenzyl chlorides $^{2m/n}$ were prepared according to literature procedures. The analytical data.
correspond to those reported in the references.

b) General procedure for the synthesis of IIEOHₘ/ₙ
Compound IIEM/n (0.4 mmol) was dissolved in dry THF (6 mL), then slowly add the LiAlH₄ (0.6 mmol, 23 mg) and placed in an ice bath. The mixture was reacted 2 h at room temperature. Water was then added slowly with vigorous stirring to terminate the reaction, and then diluted HCl was added to dissolve the precipitate. The product was extracted with CH₂Cl₂. The extracts were dried over anhydrous MgSO₄, The solvent was removed in vacuo. The obtained product was directly used for the next reaction.

c) General procedure for the synthesis of IIEM/n

The resulting benzyl alcohol IIEM/n was converted to benzyl chloride IIEM/n with thionyl chloride (SOCl₂) in dry THF (6 mL) and then added the 2 drops of DMF as catalyst. The reaction was stirred at 25 °C for 1 h, at which point the reaction was complete by TLC in (CH₂Cl₂: ethyl acetate = 40 : 1). The solvent and excess of SOCl₂ were removed at reduced pressure, affording the pure product, which was used without further purification and directly into the next reaction.

d) General procedure for the synthesis of IIEN/m/n

The appropriate IIEM/n (0.4 mmol) and NaN₃ (2.0 mmol) were dissolved in dry DMF (10 mL), KI (0.6 mmol) was added. The mixture was stirred over night at 45 °C. Afterwards, water (30 mL) and CH₂Cl₂ (90 mL) were added to the residue. The organic layer was separated and washed with brine (5×20 mL), and dried over anhydrous Na₂SO₄, the solvent was removed in vacuo. The residue was purified by column chromatography (CH₂Cl₂: ethyl acetate = 40 : 1).
