Figure S1. Photograph of (a) finger and (b) back-of-the-hand joints, showing changes in skin color with application of strain.
Figure S2. Photograph of spin-coated nanocomposite on PDMS substrate (a) with and (b) without PVA. The inset shows contact angles.
Figure S3. (a) Top and cross-sectional SEM images and (b) Raman spectra of PVA, MWCNT, PEDOT:PSS, and PVA/MWCNT/PEDOT:PSS composite.
Figure S4. (a) The PDMS (30:1) conformally attached to the fingertip with a coin. (b) Photograph of the PDMS (30:1) adhesion to the skin of the hand.
Figure S5. (a) CV curves of polyaniline nanofiber film with 10 deposition cycles at a constant scan rate of 50 mV s\(^{-1}\). (b) Top and cross-sectional SEM images of polyaniline nanofibers. (c) Current–time response at a constant voltage of 1 V for 1200 s. (d) Top and cross-sectional SEM images of V\(_2\)O\(_5\) films.
Figure S6. (a) X-ray diffraction (XRD) pattern of the polyaniline nanofiber film and (b) X-ray photoelectron spectroscopy (XPS) spectra of the V$_2$O$_5$ film.
Figure S7. Measurement of the actual strain of the finger joint flexion movements with the degree of bending and the response of the strain sensor.
Figure S8. (a) Sheet resistance of the composite film as a function of MWCNT concentration. (b) Optical transmittance in the visible range from 380 to 780 nm for composite with MWCNT concentrations of 0, 10, and 20 mg. Relative change in resistance vs. strain of the PVA/MWCNT/PEDOT:PSS nanocomposite film at different MWCNT concentrations (c) without and (d) with encapsulation.
Figure S9. SEM images of surface cracks and buckles on the nanocomposite film at $\varepsilon = 0\%$ and $\varepsilon = 50\%$, respectively.

Poisson’s ratio for the nanocomposite ($\nu_{\text{nanocomposite}}$) can be calculated by the rule of mixture; i.e., $\nu_{\text{nanocomposite}} = \nu_{\text{PEDOT:PSS}} f_{\text{PEDOT:PSS}} + \nu_{\text{MWCNT}} f_{\text{MWCNT}} + \nu_{\text{PVA}} f_{\text{PVA}}$, where $\nu_{\text{PEDOT:PSS}}$, $f_{\text{PEDOT:PSS}}$, $\nu_{\text{MWCNT}}$, $f_{\text{MWCNT}}$, $\nu_{\text{PVA}}$, and $f_{\text{PVA}}$ represent the Poisson ratio for PEDOT:PSS (0.33), MWCNT (0.06), and PVA (0.42–0.48, average 0.45) and the volume fraction of PEDOT:PSS (0.966), MWCNT (0.001), and PVA (0.033), respectively. From these equations, we can estimate $\nu_{\text{nanocomposite}}$ as 0.34.\textsuperscript{1–5} Poisson’s ratio for PDMS (30:1) is 0.5.\textsuperscript{6}
Figure S10. Chemical structures of different redox forms of polyaniline nanofibers.
Figure S11. CV curves of (a) polyaniline nanofibers / V$_2$O$_5$, (b) polyaniline nanofibers, and (c) V$_2$O$_5$ films, at a scan rate of 50 mV s$^{-1}$. 
Figure S12. Transmittance spectra for the electrochromic device of (a) polyaniline nanofibers and (b) V$_2$O$_5$, measured at −2.5 V and +2.5 V.
Figure S13. CIE 1931 Y<sub>x,y</sub> chromaticity diagram of ECD depending on different applied potentials.

The CIE chromaticity values (x, y) are (0.472, 0.517), (0.351, 0.455), and (0.202, 0.197) at -2.5 V, 0 V, and +2.5 V, respectively.
Figure S14. (a) Current change when switching between $-2.5$ V and $+2.5$ V. (b), (c) Enlargement of the charging and the discharging part, respectively.
Figure S15. Schematic illustration showing the fabrication of the patterned electrochromic device for character display.
Figure S16. Transmittance spectra of the electrochromic device at $-2.5\,\text{V}$ under flat (red) and bent (blue) states.
Figure S17. (a) I–V curves; and (b), (c) SEM images of the ITO/PET electrode in flat and bending states, respectively.
Figure S18. (a) Photograph and (b) circuit of the integrated system. (c) The source code for Arduino.

Arduino applies a bias voltage ($V_{out}$) across the ECD in accordance with the voltage ($V_{in}$) across the reference resistance ($R_r$), which is governed by the internal code. At 0% strain, $V_{in}$ is 4.5 V because $R_r$ is almost the same as the resistance of the strain sensor ($R_s$) at 0%. As the strain increases, $V_{in}$ decreases linearly. When the strain varies from 0 to 30%, $V_{out}$ changes from −2.5 V to +2.5 V.
Figure S19. Optical images of electrochromic device on (a) white paper and (b) hand skin.
Table S1. Performance compared with data from previous studies on stretchable strain sensors.
