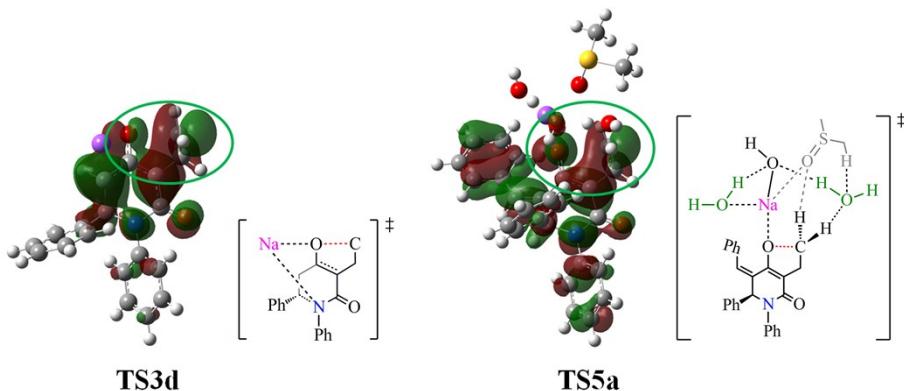

Fig. S6 Secondary orbital interactions in HOMOs of **TS3d** and **TS5a** for the concerted ring-opening and recyclization transition state (green ellipse) process.

As illustrated in **Fig. S6**, the electron delocalization of the reaction sites and the whole molecular fragments in HOMO of **TS5a** are higher than that in **TS3d**. Therefore, the cooperation of electrostatic and HBs interactions effectively stabilize the structure of **TS5a** and reduce the energy barrier of the rate-determining step.

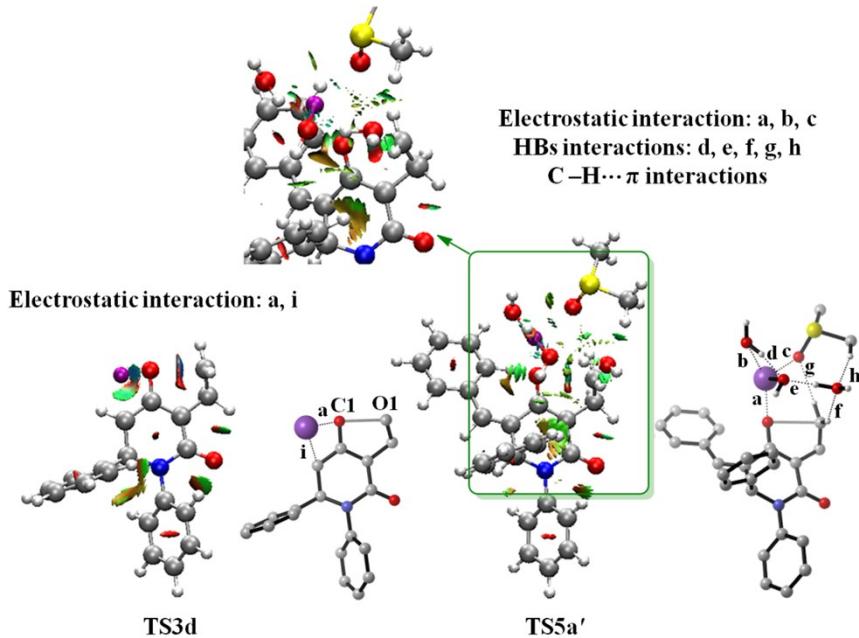

Fig. S7 Non-covalent interactions analysis (blue, strong interaction; green, weak interaction; and red, strong repulsion) for concerted ring-opening and recyclization transition states **TS3d** and **TS5a** under Na^+ -assisted and $2\text{H}_2\text{O}$ -DMSO- Na^+ co-assisted conditions.

To unravel the non-covalent interactions of transition states **TS5a** and **TS3d**, we employed the Multiwfnn^{17, 26} and VMD¹⁸ to conduct electron densities and reduced density gradient RDG²⁷ isosurface for the rate-determining step structures. As shown in Fig. S7, it is clear that both TSs have strong interactions between the reaction sites C1 and O1 represented by the deep blue color. Moreover, in **TS5a**, triple electrostatic interactions (a, b, and c) and five HBs interactions (d, e, g, h, and f) shown in green color further stabilize the **TS5a** structure as compared to $\text{Na}^+ \cdots \text{O}$ electrostatic interaction in transition state **TS3d**.

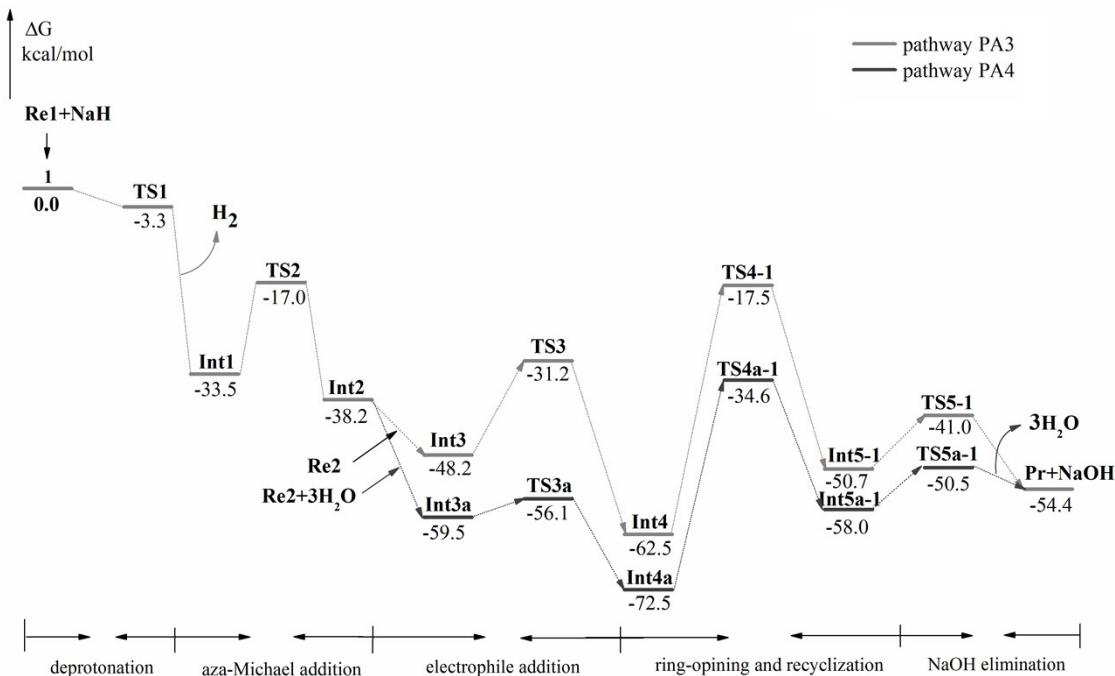

Fig. S8 DFT computed energy surfaces for the Na^+ -assisted pathway PA3 (gray line) and $3\text{H}_2\text{O}$ - Na^+ co-assisted path PA4 (dark gray line). Activation free energies are given in kcal/mol.

Additionally, we also investigated the effect of the sequence of NaOH elimination and concerted ring-opening and recyclization processes on the energy profile (Figure S4). The computational results indicated that the high activation energy barriers of **TS4'** (45.01/-17.50 kcal/mol) and **TS4b'** (41.38/-22.06 kcal/mol) are kinetically inaccessible and can be excluded.

To further shed light on the hydrogen bonding and electrostatic interactions in transition states **TS3d** and **TS5a**, topological analysis based on Bader's theory of atoms in molecules (AIM) was carried out. The AIM theory allows one to identify and characterize a bonding interaction between atoms through an analysis of the charge density ρ . In AIM topological analysis, hydrogen bond is characterized by a bond critical point (bcp) between the interacting hydrogen and hydrogen acceptor. The calculated electron density (ρ_{BCP}), Laplacian of electron density ($\nabla^2\rho_{BCP}$), and hydrogen bond distances at the critical points of the hydrogen bonds are listed in Table S2. Two and three electrostatic interactions are considered respectively in **TS3d** and **TS5a**, five HBs interactions are considered in **TS5a**. The sum of corresponding ρ and $\nabla^2\rho$ values in **TS5a** are 2.4756 and 2.2161, respectively, which is 2.0075 and 1.9206 larger than those in **TS3d** (0.4681 and 0.2955). Thus, the results of NBO and the AIM topological analyses clearly confirm that two molecules of water and solvent DMSO can intensively stabilize the structure of the transition state **TS5a** by HBs and electrostatic interactions.
