List of Known Compounds/General Methods

All starting materials reported in the manuscript have been prepared according to the method reported previously. All experiments involving palladium were performed using standard Schlenk techniques under argon atmosphere unless stated otherwise. All solvents were purchased at the highest commercial grade and used as received or after purification by passing through activated alumina columns or distillation from sodium/benzophenone under nitrogen. All solvents were deoxygenated prior to use. All other chemicals were purchased at the highest commercial grade and used as received. Reaction glassware was oven-dried at 140 °C for at least 24 h or flame-dried prior to use, allowed to cool under vacuum and purged with argon (three cycles). All products were identified using $^1$H NMR analysis and comparison with authentic samples. GC and/or GC/MS analysis was used for volatile products. All yields refer to yields determined by $^1$H NMR and/or GC or GC/MS using an internal standard (optimization) and isolated yields (preparative runs) unless stated otherwise. $^1$H NMR and $^{13}$C NMR spectra were recorded in CDCl$_3$ on Bruker spectrometers at 500 ($^1$H NMR) and 125 MHz ($^{13}$C NMR). All shifts are reported in parts per million (ppm) relative to residual CHCl$_3$ peak (7.27 and 77.2 ppm, $^1$H NMR and $^{13}$C NMR, respectively). All coupling constants ($J$) are reported in hertz (Hz). Abbreviations are: s, singlet; d, doublet; t, triplet; q, quartet; brs, broad singlet. GC-MS chromatography was performed using Agilent HP6890 GC System and Agilent 5973A inert XL EI/CI MSD using helium as the carrier gas at a flow rate of 1 mL/min and an initial oven temperature of 50 °C. The injector temperature was 250 °C. The detector temperature was 250 °C. For runs with the initial oven temperature of 50 °C, temperature was increased with a 10 °C/min ramp after 50 °C hold for 3 min to a final temperature of 220 °C, then hold at 220 °C for 15 min (splitless mode of injection, total run time of 22.0 min). High-resolution mass spectra (HRMS) were measured on a 7T Bruker Daltonics FT-MS instrument (for HRMS). Melting point was measured on MeltEMP (laboratory devices). All flash chromatography was performed using silica gel, 60 Å, 300 mesh. TLC analysis was carried out on glass plates coated with silica gel 60 F254, 0.2 mm thickness. The plates were visualized using a 254 nm ultraviolet lamp or aqueous potassium permanganate solutions. $^1$H NMR and $^{13}$C NMR data are given for all compounds in the Supplementary Information. $^1$H NMR, $^{13}$C NMR and HRMS data are reported for all new compounds. All compounds reported in this manuscript have been previously reported, unless stated otherwise. Spectroscopic data matched literature values.
**Experimental Procedures and Characterization Data**

**General Procedure for Amide Synthesis.** An oven-dried flask (25 mL) equipped with a stir bar was charged with succinimide (typically, 5.0 mmol, 1.0 equiv), 4-(dimethylamino)pyridine (typically, 0.005 equiv), triethylamine (typically, 2.0 equiv) and dichloromethane (typically, 0.50 M), placed under a positive pressure of argon, and subjected to three evacuation/backfilling cycles under high vacuum. Acyl chloride (typically, 1.0 equiv) was added dropwise to the reaction mixture with vigorous stirring at 0 °C, and the reaction mixture was stirred for 12 h at room temperature. After the indicated time, the reaction mixture was diluted with ethyl acetate (30 mL). The reaction mixture was washed with HCl (1 x 10 mL), brine (1 x 10 mL), H₂O (1 x 10 mL), dried, and concentrated. The crude product was purified by recrystallization (toluene) to afford analytically pure product.

**General Procedure for Suzuki-Miyaura Cross-Coupling of Amides.** An oven-dried vial equipped with a stir bar was charged with amide substrate (neat, 1.0 equiv), boronic acid (typically, 2.0 equiv), Pd(OAc)₂ (typically, 3 mol%), PCy₃HBF₄ (typically, 12 mol%) and Na₂CO₃ (typically, 2.5 equiv), placed under a positive pressure of argon, and subjected to three evacuation/backfilling cycles under high vacuum. Dioxane (typically, 0.25 M) was added with vigorous stirring at room temperature, the reaction mixture was placed in a preheated oil bath at 120 °C, and stirred for the indicated time at 120 °C. After the indicated time, the reaction mixture was diluted with CH₂Cl₂ (10 mL), filtered, and concentrated. The sample was analyzed by ¹H NMR (CDCl₃, 500 MHz) and GC-MS to obtain conversion, yield and selectivity using internal standard and comparison with authentic samples. Purification by chromatography on silica gel (hexanes/ethyl acetate) afforded the title product.

**Representative Procedure for Suzuki-Miyaura Cross-Coupling of Amides.** An oven-dried vial equipped with a stir bar was charged with 1-benzoylpyrrolidine-2,5-dione (neat, 40.7 mg, 0.20 mmol), p-tolylboronic acid (2.0 equiv), Pd(OAc)₂ (3 mol%), PCy₃HBF₄ (12 mol%) and Na₂CO₃ (2.5 equiv), placed under a positive pressure of argon, and subjected to three evacuation/backfilling cycles under high vacuum. Dioxane (0.25 M) was added with vigorous stirring at room temperature, the reaction mixture was placed in a preheated oil bath at 120 °C, and stirred for 15 h at 120 °C. After the indicated time, the reaction mixture was cooled down to ESI-3.
room temperature, diluted with CH$_2$Cl$_2$ (10 mL), filtered, and concentrated. A sample was analyzed by $^1$H NMR (CDCl$_3$, 500 MHz) and GC-MS to obtain conversion, yield and selectivity using internal standard and comparison with authentic samples. Purification by chromatography on silica gel (hexanes/ethyl acetate) afforded the title product. Yield 97% (38.1 mg, 0.194 mmol). White solid. Characterization data are included in the section below.
Characterization Data for Starting Materials

**Note:** All starting materials have been prepared according to the previously published procedure. The yields have not been optimized.

Selectivity Studies – Boronic Acids

General Procedure. An oven-dried vial equipped with a stir bar was charged with an amide substrate (0.1 mmol, 1.0 equiv), two boronic acid substrates (each 2.0 equiv), Pd(OAc)$_2$ (0.03 equiv), PCy$_3$HBF$_4$ (0.12 equiv) and sodium carbonate (2.5 equiv), placed under a positive pressure of argon, and subjected to three evacuation/backfilling cycles under high vacuum. Dioxane (0.25 M) was added with vigorous stirring at room temperature, the reaction mixture was placed in a preheated oil bath at 120 °C, and stirred for the indicated time at 120 °C. After the indicated time, the reaction mixture was cooled down to room temperature, diluted with CH$_2$Cl$_2$ (10 mL), filtered, and concentrated. The sample was analyzed by $^1$H NMR (CDCl$_3$, 500 MHz) and GC-MS to obtain conversion and yield using internal standard and comparison with authentic samples.
