Synthetic Procedure and Characterization Details.

**Ethyl 2-tocopheryloxy acetate (1).** In an ice cooled condition a solution of (±) α-tocopherol (10 g, 23.25 mmol) was dissolved in dry DMF (20 mL) and sodium hydride (0.84 g, 35 mmol) was added with stirring. After 15 min of stirring ethyl bromoacetate (5.83 g, 35 mmol) was added dropwise. After overnight stirring at room temperature the solvent was removed in vacuum with heating. The compound was dissolved in ethyl acetate (500 mL), washed with water (2 X 100 mL) and brine (2 X 100 mL). The separated organic solvent was dried over anhydrous sodium sulfate and evaporated to get a crude residue. Compound was purified by column chromatography with eluting pet ether and ethyl acetate (v/v 100:4) solvent mixture. Isolated yield was 7.2 g, 60%. **Fig. S3** Variation of sizes of lipoplexes at various N/P ratios (0.5-2) of optimized co-liposomes (DOPE-THnS = 2:1).

**Fig. S4A-E** Agarose gel electrophoresis for lipoplexes of DOPE-THnS (2:1) co-liposomes where n = 4, 5, 6, 8 and 12 respectively. The co-liposomes were complexed with pDNA (0.2 µg) and run on 1% agarose gel for ~30 min at 80V.
**Fig. S5A** Small angle x-ray diffraction pattern of lipoplexes with DOPE-gemini lipid co-liposomes (DOPE:THnS = 2:1) at N/P ratio 1.5. **B.** X-ray diffraction pattern of co-liposomes (DOPE:THnS = 2:1). **C.** Comparison of bilayer width of DOPE co-liposomes and their lipoplexes (N/P = 1.5). Lipoplex is mentioned as ‘lpx’.
**Fig. S6** Cellular internalization of lipoplexes (at N/P ratio of highest transfection) with fluorescein labeled pGL3 in A549 cell lines. The co-liposomal formulations of DOPE-TH8S (2:1), DOPE-THM (2:1), DOPE-T8T (4:1) and L2K were used here. The confocal microscopy images were taken after 6h of treatment with the lipoplexes.

The co-liposomal formulations of DOPE-TH8S (2:1), DOPE-T8T (4:1) and DOPE-THM (2:1) were used in this experiment.
