**General consideration.**

The $^1$H and $^{13}$C NMR spectra were recorded using a Bruker 600 or 400 MHz spectrometer {H}. Mass spectrometry were recorded on ACQUITY UPLC LCT Premier XE. Elemental analysis were recorded on Vario EL c. Size exclusion chromatography (SEC) was performed on Waters 1515 pump and Waters 2414 differential refractive index (RI) detector (set at 40 °C) using a series of linear Styrigel HR1, HR2 and HR4 columns. Molecular weight ($M_n$) and its polydispersity ($M_w/M_n$) data are reported relative to polystyrene standards. The eluent was tetrahydrofuran (THF) at a flow rate of 0.3 mL/min. FT-IR spectra were recorded on Perkin-Elmer Spectrum BX FT-IR system using KBr pellets. UV-vis spectra were performed on a UNIC 4802 UV/VIS double beam spectrophotometer in 1.0 cm length quartz cell. Circular dichroism (CD) spectra were obtained in a 1.0 mm quartz cell at 25 °C using a JASCO J1500 spectropolarimeter. The polymer concentration was calculated on the basis of the monomer units and was 0.20 mg/mL. Emission spectra were recorded on Hitachi F-4600 fluorescence spectrophotometer. Dynamic light scattering (DLS) was recorded using a Nano-ZS 90 Zetasizer of Malvern (UK) instrument. All samples were filtered with syringe filters (0.8 μm pore size, Cellulose Acetate filter media) prior to the measurements, and all data were averaged over three time measurements. Samples for atomic force microscopy (AFM) measurements were prepared by drop casting solutions of polymer onto pre-cleaned silicon wafers or mica placed. AFM images were acquired in tapping mode with a Digital Instruments Dimension 3100 Scanning Probe Microscope, performed at room temperature in air using standard silicon cantilevers with a nominal spring constant of 50 N/m and resonance frequency of ~300 kHz. Scanning electron microscopy (SEM) was performed on a SU8020 operating at 5.0 kV accelerating voltage.

All solvents were obtained from Sinopharm. Co. Ltd., and were purified by the standard procedures.

MA-poly-\(\text{2}_\text{ms}\) and BA-poly-\(\text{2}_\text{ms}\) were purchased from Aladdin and Sigma-Aldrich.
Co. Ltd., and were used as received without further purification otherwise denoted. Phenyl isocyanide monomers \(1\text{a}^1, 1\text{L}, 1\text{D}^2\)
dansyl modified L- and D-phenylalanine (L- or D-DNSP),\(^3\) were prepared according to the literatures and
the structures were confirmed by \(^1\text{H}\) NMR. All the polymerizations was carried out in a dry glass ampule
under a dry nitrogen atmosphere.

**Synthesis of MA-poly-1\text{ms}:**

*Synthesis of 3.* 5-Trimethylsilyl-4-propyn-1-ol (2.98 mL, 16.42 mmol) was added to a mixture of 4-
ethynylbenzoic acid (2.00 g, 13.68 mmol), EDCI (3.28 g, 16.42 mmol) and DMAP (0.84 g, 6.84 mmol)
in dichloromethane (50 mL) via a syringe. The resulting solution was stirred at room temperature for 3 h,
and quenched by water. The organic layer was washed with sodium bicarbonate (10 mL × 3) and brine
(10 mL × 3), dried over anhydrous Na\(_2\)SO\(_4\) and concentrated to dryness. The isolated residue was further
purified by silica gel chromatography (eluent: \(n\)-hexane/ethyl acetate = 50/1, v/v) to give 3 as a white solid

**Synthesis of MA-poly-1a$_{100}$:** A 10 mL oven-dried flask was charged with monomer 1a (0.11 g, 3.32 μmol), THF (1.64 mL) and a stir bar. To this stirring solution was added a solution of 5 in THF via a microsyringe at room temperature. The concentrations of monomer 1a and initiator 5 were 0.2 and 0.002 M, respectively ([1a]$_0$/[2]$_0$ = 100). The reaction flask was then immersed into an oil bath at 55 °C and stirred for 9 h. After cooled to room temperature, the polymerization solution was precipitated into a large amount of methanol, collected by centrifugation, and dried in vacuum at room temperature overnight afforded MA-poly-1a$_{100}$ as a yellow solid (0.10 g, 92% yield). SEC: $M_n = 26.9$ kDa, $M_w/M_n = 1.21$. $^1$H NMR (600 MHz, CDCl$_3$, 25 °C): $\delta$ 7.31 (br, aromatic), 5.73 (br, aromatic), 4.04–3.82 (br, OCH$_2$), 1.63–0.85 (br, CH$_2$ and CH$_3$). Synthesis of helix-coil and helix-coil-helix block copolymers:

**Synthesis of poly(1a₁₀₀-b-2₄₅).** A 100 mL oven-dried, three-neck flask equipped with a stir bar was evacuated and purged with N₂ three times prior to addition of any reagents. MA-poly-1a₁₀₀ (100.0 mg, SEC: \( M_n = 26.9 \text{ kDa}, \ M_w/M_n = 1.21 \)) and MA-poly-2₄₅ (66.5 mg, SEC: \( M_n = 2.0 \text{ kDa}, \ M_w/M_n = 1.15 \)) were dissolved in THF and added to the purged flask via a syringe under a constant N₂ flow. DBU (1.98 \( \mu L, \ 13.30 \mu \text{mol} \)) was then added to the stirring mixture followed by CuI (0.17 mg, 0.67 \( \mu \text{mol} \)) and the stirring reaction mixture was heated to 40 °C in a preheated oil bath for 24 h. Upon cooling to room temperature, the solution was concentrated slightly and precipitated into methanol. The solid was isolated via filtration and dried under vacuum at room temperature, afford poly(1a₁₀₀-b-2₄₅) as a yellow solid (121.1 mg, 73% yield). Synthesis of BA-poly-Ia_{100}: A 10 mL oven-dried flask was charged with monomer Ia (100.0 mg, 0.35 mmol), THF (1.75 mL) and a stir bar. To this stirring solution was added a solution of 8 in THF via a microsyringe at ambient temperature. The concentrations of monomer Ia and initiator 8 were 0.2 and 0.002 M, respectively ([Ia]₀/[8]₀=100). The reaction flask was then immersed into an oil bath at 55 °C and stirred for 11 h. After cooled to room temperature, the polymerization solution was precipitated into a large amount of methanol, collected by centrifugation, and dried in vacuum at room temperature overnight afford BA-poly-Ia_{100} as a yellow solid (92.0 mg, 92% yield). Synthesis of D/L-Ala-DNSP

Scheme S1. Synthesis of D/L-Ala-DNSP
Synthesis of L-Ala-DNSP: Dansyl chloride (2.74 g, 10.19 mmol) was added dropwise to a solution of methyl L-alanine (1.05 g, 10.19 mmol) and TEA (1.23 g, 12.23 mmol) in CH2Cl2 (30 mL) at 0 °C. After the mixture was stirred for 12 hour at room temperature, the resulting solution was washed with water (30 mL), brine, dried over Na2SO4, and concentrated under reduced pressure. The residue was purified by silica gel chromatography (eluent: n-hexane/ethyl acetate = 5/1, v/v) to give L-Ala-DNSP (2.77 g, 81% yield). Mp: 109.1‒111.7 °C. 1H NMR (400 MHz, CDCl3, 25 °C): δ 8.55‒7.18 (m, 7H, aromatic and NH), 4.01‒3.94 (m, 1H, CHCO2), 3.34 (s, 3H, CO2CH3), 2.88 (s, 6H, NCH3), 1.31‒1.29 (d, J = 7.2 Hz, 3H, CHCH3). 13C NMR (150 MHz, CDCl3, 25 °C): δ 172.41, 152.05, 134.77, 131.88, 130.84, 129.79, 129.75, 128.59, 127.18, 123.24, 118.94, 115.40, 52.47, 51.82, 45.55, 19.80. **AFM and SEM observations:** All samples reported were prepared by passing dilute copolymer solutions through 0.45 μm PTFE syringe filters and dropped onto a clear, precleaned silicon wafers. Taking poly(1L_{100}-b-2_{450}) as an example, the copolymer (1.00 mg) was first dissolved in THF (0.40 mL) and then added water (2.00 mL) dropwise under high speed stirring. THF was removed by dialysis against deionized water with slow stirring for two days. Sample preparation through filtration and then drop onto the silicon wafer. After the sample was slowly dried in air, it was subjected to AFM and SEM observations.

**Critical aggregation concentration (CAC):** The CACs of the amphiphilic block and star copolymers were determined by fluorimetry method with pyrene as fluorescent probe. Taking poly(1L_{100}-b-2_{450}) as an example, a flask equipped with a stir bar was filled with poly(1L_{100}-b-2_{450}) (10.00 mg) and THF (1.00 mL). Water (5.00 mL) was added by the injection pump at the rate of 2.5 mL h⁻¹. After the addition, THF was removed by dialysis against deionized water with slow stirring for two days. The resulting solution was dilution and transfer into screw bottle with pyrene solution of acetone (c = 3 \times 10^{-5} M), the acetone have been evaporated. After ultrasonication for a short while, the solutions were monitored by fluorescence spectrometer.

**Chiral recognition:** Taking poly(1L_{100}-b-2_{450}) as an example, poly(1L_{100}-b-2_{450}) (2.00 mg) was dissolved in THF (0.50 mL) at room temperature. To this high speed stirring solution, water (4.00 mL) was added dropwise, then L- or D-DNSP (1.00 mg) was added. After ultrasonication for a short while, the suspensions containing DNSP and copolymer were monitored by fluorescence spectrometer.
