Figure S1. 1H NMR spectrum of PAGE-b-PEG-b-PAGE (polymer 1) triblock (500 MHz, 293 K, CDCl3)

Figure S2. PAGE18.5-b-PEG181-b-PAGE18.5 (polymer 1) 15 wt % concentration hydrogel

Figure S3. 1H NMR spectrum of PiPGE-stat-PAGE-b-PEG-b-PiPGE-stat-PAGE (polymer 3) triblock (500 MHz, 293 K, CDCl3)

Figure S4. 1H NMR spectrum of PEGE-stat-PAGE-b-PEG-b-PEGE-stat-PAGE (polymer 6) triblock (500 MHz, 293 K, CDCl3)

Figure S5. Dynamic oscillatory UV cure experiment showing increase in storage modulus when lamp is turned on at the 60 second mark for 10 minutes of irradiation. Experiment performed on a) polymer 4 with different photoinitiator concentrations based on polymer weight. b) polymer 4 with 1 wt % photoinitiator and different concentrations of ethanedithiol based on polymer weight.

Figure S6. Cross-linked polymer 4 with 5 wt % ethanedithiol of the polymer mass after UV curing experiment. Addition of dithiol adds turbidity to the gel.

Figure S7. 3D printed structures of polymer 4 a) grid printed with 0.26 mm inner diameter nozzle. b) grid printed with 0.41 mm inner diameter nozzle. c,d) cross-linked gels of a and b respectively. All structures were printed from a direct-write printer at 5 mm/s (scale bar 2 mm).

Figure S8. 1H NMR spectrum of PEGE-b-PEG-b-PEGE (polymer 2) triblock (500 MHz, 293 K, CDCl3)

Figure S9. Dynamic oscillatory temperature ramp experiment showing storage (filled) and loss (open) moduli performed on polymer 2. Experiment shows that PEGE-b-PEG-b-PEGE hydrogels are not viable for printing but can assist in the gelation properties of PEGE-stat-PAGE-b-PEG-b-PEGE-stat-PAGE hydrogels.

Figure S10. Dynamic oscillatory UV cure experiment on a triblock copolymer of PiPGE-b-PEG-b-PiPGE showing no increase in storage modulus after UV lamp is turned on. The slight slope shown in the graph is due to heating of the plate during lamp irradiation.

Figure S11. Dynamic oscillatory UV cure experiment showing increase in storage modulus when lamp is turned on at the 60 second mark for 10 minutes of irradiation. Experiment performed on (a) polymer 5 at 13.5 wt % and (b) polymer 5 treated with DOWEX cationic exchange resin to hydrolyze vinyl ethers. Both polymers form cross-linked networks upon exposure to UV light in the presence of photoinitiator suggesting that vinyl ether itself is not necessary for cross-linking.

Figure S12. Dynamic oscillatory UV cure experiment showing increase in storage modulus when lamp is turned on at the 60 second mark for 10 minutes of irradiation. Experiment performed on polymer 6 at 20 wt % with 1 wt % photoinitiator with varied UV light intensities showing the rate of cross-linking can be controlled with lamp power.
Figure S13. Viscosity vs shear rate profiles comparing 40 mm cone and plate geometry with 20 mm parallel plate geometry. Experiment performed on polymer 4 at 18 wt %. Graph indicates that there is not a significant difference between geometries.

Figure S14. Viscosity vs shear rate profiles comparing 40 mm cone and plate geometry with 20 mm parallel plate geometry. Experiment performed on polymer 6 at 20 wt %. Graph indicates that there is not a significant difference between geometries.
Calculation of $M_n$

Number average molecular weight was calculated using $^1$H NMR and an example for a copolymer of PiPGE-stat-PAGE-b-PEG-b-PiPGE-stat-PAGE is given. The $M_n$ of PEG is 8k Da which corresponds to approximately 182 ethylene glycol units per macroinitiator. If we use Figure S3 as the example spectrum then the number of isopropyl and allyl glycidyl ether units can be calculated by finding the PEG to PiPGE and PEG to PAGE ratio. The integration for the peak at 2 ppm corresponds to the methyl groups on iPGE and is usually set to 1. The peaks between 3.2 and 3.9 correspond to protons e-m and were integrated to a value of 8, and the peaks at 4, 5.1 to 5.3, and 5.9 ppm corresponding to proton a-d equaled a total of 0.125. Since iPGE and AGE have peaks that overlap in the 3.5 ppm region, their contribution to the overall integration must be subtracted as shown below.

$$\frac{182 \text{ ethylene glycol units}}{\left(\frac{6 \text{ PiPGE CH}_3}{4 \text{ PEG CH}_2}\right) \times (8 - 1 - 0.125)} = 17.6 \text{ iPGE units}$$

Then, the integrations for PAGE allyl and vinyl protons at 4, 5.1 to 5.3, and 5.9 ppm can be summed and multiplied by the number of iPGE units to give the number of AGE units as shown below.

$$0.125 \times \frac{6 \text{ PiPGE CH}_3}{5 \text{ PAGE CH}_2 + CH} \times 17.6 = 2.6 \text{ AGE units}$$

Supplementary Experimental Details

Synthesis of poly(allyl glycidyl ether)-b-poly(ethylene glycol)-b-poly(allyl glycidyl ether) (PAGE-b-PEG-b-PAGE)

PEG (10 g, 1.25 mmol, $M_n = 8,000$ g/mol) was dried under reduced pressure in a reaction vessel at 50 °C overnight. THF (100 mL) was added under an argon atmosphere to dissolve PEG at room temperature. Potassium naphthalenide solution was titrated into the flask until a slight green color persisted, indicating that the hydroxyl groups of the PEG have been fully deprotonated. The reaction vessel was then warmed to 30 °C and AGE (4 mL, 34 mmol) was added via buret. The reaction was left to stir for 48 h and was quenched with degassed acidic methanol (10 mL, 1 v/v % acetic acid). The reaction mixture was concentrated under reduced pressure and added to cold diethyl ether to precipitate. The resulting suspension was poured into centrifuge tubes and spun at 4400 rpm for 10 min. The supernatant was decanted and resulting material was dried in a vacuum oven to afford a white solid. $^1$H NMR (500 MHz, CDCl$_3$): δ 5.86-5.95 (m, 1 H, CH$_2$-CH=CH$_2$), 5.15-5.30 (m, 2 H, CH$_2$-CH=CH$_2$), 4.01 (s, 2 H, O-CH$_2$-CH=CH$_2$), 3.47-3.89 (m, 4 H, + 5 H, PEG backbone, PAGE backbone). $M_n = 10800$ g/mol (determined by $^1$H NMR 500 MHz, CDCl$_3$). Đ = 1.11 (determined by SEC using RI detection and CHCl$_3$ as eluent).

Synthesis of poly(ethyl glycidyl ether)-b-poly(ethylene glycol)-b-poly(ethyl glycidyl ether) (PEGE-b-PEG-b-PEGE)

PEG (10 g, 1.25 mmol, $M_n = 8,000$ g/mol) was dried under reduced pressure in a reaction vessel at 50 °C overnight. THF (100 mL) was added under an argon atmosphere to dissolve PEG at room temperature. Potassium naphthalenide solution was titrated into the flask until a slight green color persisted, indicating that the hydroxyl groups of the PEG have been fully deprotonated. The reaction vessel was then warmed to 50 °C and EGE (4.8 mL, 44 mmol) was added via buret. The reaction was left to stir for 48 h and was quenched with degassed acidic methanol (10 mL, 1 v/v % acetic acid). The reaction mixture
was concentrated under reduced pressure and added to cold diethyl ether to precipitate. The resulting suspension was poured into centrifuge tubes and spun at 4400 rpm for 10 min. The supernatant was decanted and resulting material was dried in a vacuum oven to afford a white solid. $^1$H NMR (500 MHz, CDCl$_3$): $\delta$ 3.48-3.92 (m, 4 H, +7 H, PEG backbone, PEGE backbone), 1.18-1.19 (m, 3 H, O-CH$_2$CH$_3$). $M_n = 11300$ g/mol (determined by $^1$H NMR 500 MHz, CDCl$_3$). $\bar{D} = 1.11$ (determined by SEC using RI detection and CHCl$_3$ as eluent).

**Synthesis of poly(isopropyl glycidyl ether)-stat-poly(allyl glycidyl ether)-b-poly(ethylene glycol)-b-poly(isopropyl glycidyl ether)-stat-poly(allyl glycidyl ether)** (PiPGE-stat-PAGE-b-PEG-b-PiPGE-stat-PAGE)

PEG (10 g, 1.25 mmol, $M_n = 8,000$ g/mol) was dried under reduced pressure in a reaction vessel at 50 °C overnight. THF (100 mL) was added under an argon atmosphere to dissolve PEG at room temperature. Potassium naphthalenide solution was titrated into the flask until a slight green color persisted, indicating that the hydroxyl groups of the PEG have been fully deprotonated. The reaction vessel was then warmed to 30 °C AGE (0.72 mL, 6.1 mmol) and iPGE (3.3 mL, 26 mmol) were added via burets. The reaction was left to stir for 48 h and was quenched with degassed acidic methanol (10 mL, 1 v/v % acetic acid). The reaction mixture was concentrated under reduced pressure and added to cold diethyl ether to precipitate. The resulting suspension was poured into centrifuge tubes and spun at 4400 rpm for 10 min. The supernatant was decanted and resulting material was dried in a vacuum oven to afford a white solid. $^1$H NMR (500 MHz, CDCl$_3$): $\delta$ 5.88-5.97 (m, 1 H, CH$_2$-C=CH$_2$), 5.16-5.28 (m, 2 H, CH$_2$-CH=CH$_2$), 3.99 (s, 2 H, O-CH$_2$-CH=CH$_2$), 3.47-3.89 (m, 4 H, +5 H, +6 H, PEG backbone, PAGE backbone, PiPGE backbone), 1.14-1.21 (d, 6 H, O-CH$_2$CH$_3$). $M_n = 10700$ g/mol (determined by $^1$H NMR 500 MHz, CDCl$_3$). $\bar{D} = 1.11$ (determined by SEC using RI detection and CHCl$_3$ as eluent).

**Synthesis of poly(ethyl glycidyl ether)-stat-poly(allyl glycidyl ether)-b-poly(ethylene glycol)-b-poly(ethyl glycidyl ether)-stat-poly(allyl glycidyl ether)** (PEGE-stat-PAGE-b-PEG-b-PEGE-stat-PAGE)

PEG (10 g, 1.25 mmol, $M_n = 8,000$ g/mol) was dried under reduced pressure in a reaction vessel at 50 °C overnight. THF (100 mL) was added under an argon atmosphere to dissolve PEG at room temperature. Potassium naphthalenide solution was titrated into the flask until a slight green color persisted, indicating that the hydroxyl groups of the PEG have been fully deprotonated. The reaction vessel was then warmed to 30 °C AGE (3.1 mL, 26 mmol) and EGE (1.8 mL, 15 mmol) were added via burets. The reaction was left to stir for 48 h and was quenched with degassed acidic methanol (10 mL, 1 v/v % acetic acid). The reaction mixture was concentrated under reduced pressure and added to cold diethyl ether to precipitate. The resulting suspension was poured into centrifuge tubes and spun at 4400 rpm for 10 min. The supernatant was decanted and resulting material was dried in a vacuum oven to afford a white solid. $^1$H NMR (500 MHz, CDCl$_3$): $\delta$ 5.88-5.89 (m, 1 H, CH$_2$-CH=CH$_2$), 5.14-5.27 (m, 2 H, CH$_2$-CH=CH$_2$), 3.98 (s, 2 H, O-CH$_2$-CH=CH$_2$), 3.48-3.89 (m, 4 H, +5 H, +7 H, PEG backbone, PAGE backbone, PEGE backbone), 1.18 (m, 3 H, O-CH-CH$_3$). $M_n = 11300$ g/mol (determined by $^1$H NMR 500 MHz, CDCl$_3$). $\bar{D} = 1.11$ (determined by SEC using RI detection and CHCl$_3$ as eluent).
