EXPERIMENTAL INFORMATION

All reagents were purchased from Sigma Aldrich, Acros organics, and J&K scientific.

GPC measurements were carried out with a Shimadzu 10A apparatus with a PLgel 5 μm mixed D column. The measurements were done in tetrahydrofurane (THF) as eluent toward poly(styrene) standards. ¹H NMR measurements were done with a Bruker Avance 300 MHz for the monomers, a Bruker Avance 400 MHz for the initiators, and a Bruker Avance 600 MHz for the different polymers. UV-vis and CD spectra were obtained respectively with a Perkin Elmer Lambda 900 and a JASCO J-810 spectrometer. MALDI-ToF mass spectra were acquired on a Waters QToF Premier mass spectrometer equipped with a Nd:YAG laser, operating at 355 nm (third harmonic) with a maximum output of 66.3 μJ per surface unit delivered to the sample in 2.2 ns pulses at 50 Hz repeating rate. Time-of-Flight mass analyses were performed in the reflectron mode at a resolution of about 10k and the samples were analyzed using trans-2-[3-(4-tertbutylphenyl)-2-methylprop-2-enylidene]-malononitrile (DCTB), as a matrix at 40 mg mL⁻¹ solution in CHCl₃. Polythiophene samples were dissolved in CHCl₃ to obtain 1 mg mL⁻¹ solutions. Aliquots (1 μL) of those solutions were applied onto the target area already bearing the matrix crystals, and air-dried. For the recording of the single-stage MS spectra, the quadrupole (rf-only mode) was set to pass all the ions of the distribution, and they were transmitted into the pusher region of the time-of-flight analyser where they were mass analysed with 1 s integration time. Data were acquired in continuum mode until acceptable averaged data were obtained.

SYNTHESIS OF THE PRECURSOR MONOMERS

(-)-(R)-2-bromo-5-iodo-3-(3,7-dimethyloctyl)thiophene and (+)-(S)-2-bromo-5-iodo-3-(3,7-dimethyloctyl)thiophene were prepared according to literature procedures¹.
SYNTHESIS OF THE PRECURSOR INITIATORS

Bomo-(o-methylbenzene)-bis(triphenylphosphine)nickel(II) (1)

Precursor initiators 1 was synthesized according to the literature.1,2

Yield 1: 0.7872 g (26%)

Bomo-(o-ethylbenzene)-bis(triphenylphosphine)nickel(II) (2)

A solution of 1-bromo-(2-ethyl)benzene (8.85 mmol; 1.64 g) in dry toluene (150 mL) under N₂ is added to Ni(PPh₃)₄ (6.00 mmol; 6.65 g). The reaction mixture is protected from light and stirred for 15 hours at room temperature. After filtration the solution is concentrated under reduced pressure at 30°C, precipitated in pentane and filtered. The solution is isolated as an orange powder.

Yield 2: 1.82 g (37%)

¹H NMR (400 MHz, CD₂Cl₂) δ: 7.50 (m, 12H); 7.38 (t, 6H); 7.28 (t, 12H); 7.14 (d, 1H); 6.46 (t, 1H); 6.30 (t; 1H); 6.07 (d; 1H); 2.87 (q, 2H); 0.56 (t, 3H, 7.5 Hz)

³¹P NMR (400 MHz, CDCl₃) δ: 21.75 (s)

Bomo-(o-i-propylbenzene)-bis(triphenylphosphine)nickel(II) (3)

A solution of 1-bromo-(2-(i-propyl))benzene (9.00 mmol; 1.79 g) in dry toluene (150 mL) under N₂ is added to Ni(PPh₃)₄ (6.00 mmol; 6.65 g). The reaction mixture is protected from light and stirred for 15 hours at room temperature. After filtration the solution is concentrated under reduced pressure at 30°C, precipitated in pentane and filtered. The solution is isolated as an orange powder.

Yield 3: 2.74 g (50%)
$^1$H NMR (400 MHz, CD2Cl2) δ: 7.40 (m, 18H); 7.26 (t, 12H); 6.49 (m, 3H); 5.99 (m, 1H); 4.89 (m, 1H); 0.90 (d, 6H, 6.9 Hz)

$^{31}$P NMR (400 MHz, CDCl$_3$) δ: 19.15 (s)

SYNTHESIS OF THE POLYMERS

**M-P1a, E-P1a, iP-P1a**

An overview of the polymerization of M-P1a, E-P1a and iP-P1a can be found in scheme S1.

![Scheme S1. Schematic representation of KCTP of polymers M-P1a, E-P1a and iP-P1a with respectively initiators In M, In E and In iP.](image)

(+)-(S)-2-bromo-5-iodo-3-(3',7'-dimethyloctyl)thiophene (4) (0.525 mmol; 0.225 g) was purged with argon and dissolved in dry THF (4.806 ml). Next, i-PrMgCl-LiCl (0.525 mmol; 0.444 mL) was added and the solution was stirred for 30 minutes at room temperature. In the meantime dpff (0.0125 mmol; 5.20 mg) and precursor initiator 1 (0.00625 mmol; 5.10 mg) were purged with argon and dissolved in dry THF (1.5 mL). This reaction mixture was stirred for 15 minutes at room temperature. 5 mL of the obtained (S) monomer solution was transferred
to the initiator mixture and stirred at room temperature. The 0.25 mL (S) monomer solution left, was quenched with 0.50 mL D$_2$O for $^1$H NMR analysis. After a polymerization time of 90 minutes, the polymerization was terminated with a 2 M HCl in THF solution. This mixture was concentrated under reduced pressure, and the polymer was precipitated in methanol. Next, the polymer was filtered and fractionated by Soxhlet extraction with methanol and chloroform. The chloroform fraction was concentrated, the polymer was precipitated in methanol, filtered, and dried under reduced pressure. Polymer M-P1a was recovered as a dark purple solid.

The same was done in order to obtain polymers E-P1a and iP-P1a with respectively precursor initiator 2 and 3.

Yield: M-P1a: 0.067 g; E-P1a: 0.061 g; iP-P1a: 0.059 g

**E-P(2-5)a, iP-P(2-5)a, E-P(2-5)b, iP-P(2-5)b**

An overview of the polymerization of E-P(2-5)a, iP-P(2-5)a, E-P(2-5)b and iP-P(2-5)b can be found in scheme S2.
(+)-(S)-2-bromo-5-iodo-3-(3’,7’-dimethyloctyl)thiophene (4) (2,78 mmol; 1,19 g) was purged with argon and dissolved in dry THF (25,6 ml). Next, i-PrMgCl-LiCl (2,78 mmol; 1,26M; 2,20 mL) was added and the solution was stirred for 30 minutes at room temperature. In the meantime dppp and precursor initiator 2 and 3 were divided in different flasks as shown in table S1, purged with argon, and dissolved in dry THF (1,5 mL). These reaction mixtures were stirred for 15 minutes at room temperature. 2 x 4,375 mL, 2 x 3, 750 mL, 2 x 3,125 mL and 2 x 2,500 mL of the (S) solution were transferred to the different flasks in order to form the first blocks of the different block copolymers. The 0,25 mL (S) monomer solution left, was quenched with 0,50 mL D$_2$O for $^1$H NMR analysis. After a polymerization time of 70 minutes at room temperature, 1/5 of the volume of the different solutions were transferred to separated - with argon purged - flasks and terminated with a 2 M HCl in THF solution in order to respectively...
obtain E-P2a, iP-P2a, E-P3a, iP-P3a, E-P4a, iP-P4a, E-P5a and iP-P5a. These mixtures were concentrated under reduced pressure, and the polymers were precipitated in methanol. Next, the polymers were filtered and fractionated by Soxhlet extraction with methanol and chloroform. The chloroform fractions were concentrated, the polymers were precipitated in methanol, filtered, and dried under reduced pressure. Polymers E-P2a, iP-P2a, E-P3a, iP-P3a, E-P4a, iP-P4a, E-P5a and iP-P5a were recovered as dark purple solids.

To the left polymerization solutions (4/5 volume) respectively 2 x 0.50 mL, 2 x 1.00 mL, 2 x 1.50 mL and 2 x 2.00 mL of the (R) monomer solution were transferred. This monomer was obtained by reaction of (-)-(R)-2-bromo-5-iodo-3-(3',7'-dimethyloctyl)thiophene (5) (1.03 mmol; 0.440 g) with t-PrMgCl·LiCl (1.03 mmol; 1.26M; 0.81 mL) in dry THF for 30 minutes. The 0.25 mL (R) monomer solution left, was quenched with 0.50 mL D2O for 1H NMR analysis. The polymerization mixtures are stirred at room temperature. After 45 minutes the solutions of E-P2b and iP-P2b were terminated with a 2 M HCl in THF solution. The same was done for E-P3b and iP-P3b 30 minutes later and again for E-P4a and iP-P4a 15 minutes later. After a polymerization time of 120 minutes also E-P5a and iP-P5a were terminated with a 2 M HCl in THF solution. The different mixtures were concentrated under reduced pressure, and the polymers were precipitated in methanol. Next, the polymers were filtered and fractionated by Soxhlet extraction with methanol and chloroform. The chloroform fractions were concentrated, the polymers were precipitated in methanol, filtered, and dried under reduced pressure. Polymers E-P2b, iP-P2b, E-P3b, iP-P3b, E-P4b, iP-P4b, E-P5b and iP-P5b were recovered as dark purple solids.

Yield: E-P2b: 64 mg; iP-P2b: 68.4 mg; E-P3b: 67.9 mg; iP-P3b: 77.4 mg; E-P4b: 66.9 mg; iP-P4b: 70.3 mg; E-P5b: 66.3 mg; iP-P5b: 59.4 mg
Table S1. Overview amounts of precursor initiator 2, precursor initiator 3 and dppp used for the polymerization of E-P2b, iP-P2b, E-P3b, iP-P3b, E-P4b, iP-P4b, E-P5b and iP-P5b.

**M-P(2-5)a, M-P(2-5)b**

An overview of the polymerization of M-P(2-5)a and M-P(2-5)b can be found in scheme S2.

The polymerization proceeds as for E-P(2-5)a, iP-P(2-5)a, E-P(2-5)b and iP-P(2-5)b but with the amounts as shown in table S2.

Table S2. Overview amounts of monomer (S), monomer (R), precursor initiator 1 and dppp used for the synthesis of M-P2b, M-P3b, M-P4b and M-P5b.

CD SPECTRA

The influence of the end-group of the self-assembly of the different polymer series is analyzed using CD spectroscopy. First the polymers are solubilized in CHCl$_3$. Upon the addition of about methanol (MeOH) the polymers start to stack.
