Scheme S1. Synthesis of N-substituted maleimide

Figure S1. $^1$H NMR spectra of monomer N-propylmaleimides(MI) in CDCl$_3$
**Equation S1.**

Normalized chain length \((i-1)-i = (\text{Conv}_{\text{total}} (i-1) + \text{Conv}_{\text{total}} (i)) / 2 \text{Conv}_{\text{max}};\)

Normalized chain length \((i) = \text{Conv}_{\text{total}} (i) / \text{Conv}_{\text{max}};\)

\[ F_{\text{cum}, \text{VAc}} (i) = \left(\frac{200 \times \text{Conv. VAc}}{200 \times \text{Conv. MI} + 200 \times \text{Conv. VAc}}\right) \text{ (Conv.}_{\text{max}} \text{ equal to the maximum value of Conv.}_{\text{total}});\]

\[ F_{\text{inst}, \text{VAc}} ((i-1)-i) = \frac{(\text{Conv.}_{\text{total}} (i) \times F_{\text{cum}, \text{VAc}} (i) - \text{Conv.}_{\text{total}} (i-1) \times F_{\text{cum}, \text{VAc}} (i-1))}{\left[ (\text{Conv.}_{\text{total}} (i) \times F_{\text{cum}, \text{VAc}} (i)) - (\text{Conv.}_{\text{total}} (i) \times F_{\text{cum}, \text{MI}} (i) - \text{Conv.}_{\text{total}} (i-1) \times F_{\text{cum}, \text{MI}} (i-1)) \right]}.\]

**Figure S2.** Direct \(^1\text{H NMR analysis spectra of monomer conversion in CDCl}_3.\) The integral of the signal of proton (g) belong to HFIP in the 1H NMR was set to be 1.0, served as internal standard for the decrease of the integral of double bonds belong to each monomer. 0 h and 3 h was toward initial time and the third hour of the whole copolymerization. \(\text{Conv.}_{\text{MI}} = I_{6.7,0 \text{h}} - I_{6.7,3 \text{h}} / I_{6.7,0 \text{h}} \times 100\%;\) \(\text{Conv.}_{\text{VAc}} = I_{4.9,0 \text{h}} - I_{4.9,3 \text{h}} / I_{4.9,0 \text{h}} \times 100\%;\) The conversion of monomer at other times is similar to the calculation illustrated above.
Figure S3. Polymerization behavior of blue light-induced RAFT copolymerization of MI(M1) and VAc(M2) at 25 °C using HFIP as solvent. (a) Relationships of Mn and Mw/Mn with conversion in molar ratio of [VAc]₀/[MI]₀/[EXEP]₀ equals to 200/(200, 300, 133)/1; b-d) GPC traces of polymers obtained with molar ratio of [VAc]₀/[MI]₀ equals to 200/200 (b), 200/300(c), 300/200(d). The unit of all the molecular weight showing in the GPC traces is g mol⁻¹.

Figure S4. (a) Number-average molecular weights (Mn) and molecular weight distributions (Mw/Mn) of the copolymers from blue light-induced and Xanthate (EXEP) mediated RAFT copolymerization of MI (M) and VAc (V) at 25 °C using Dioxane as solvent. [VAc]₀/[MI]₀/[EXEP]₀ = 200/(200, 300, 133)/1. GPC traces: [VAc]₀/[MI]₀ = (b) 200/200, (c) 200/300, (d) 300/200. The unit of all the molecular weight showing
in the GPC traces is g mol$^{-1}$. Reaction conditions are the same as FigureS3.

**Figure S5.** First-order kinetic plots for RAFT copolymerization of MI and VAc at 60 °C using HFIP as solvent. Different feeding ratio toward each graph: (a): [VAc]$_0$ /[MI]$_0$ /[EXEP]$_0$ /[AIBN]$_0$ = 200/200/1/1; (b): [VAc]$_0$ /[MI]$_0$ /[EXEP]$_0$ /[AIBN]$_0$ = 200/300/1/1; (c): [VAc]$_0$ /[MI]$_0$ /[EXEP]$_0$ /[AIBN]$_0$ = 300/200/1/1.
Figure S6. First-order kinetic plots for RAFT copolymerization of MI and VAc at 60 °C using dioxane as solvent. Different feeding ratio toward each graph: (a): [VAc]₀/[MI]₀/[EXEP]₀/[AIBN]₀ = 200/200/1/1; (b): [VAc]₀/[MI]₀/[EXEP]₀/[AIBN]₀ = 200/300/1/1; (c): [VAc]₀/[MI]₀/[EXEP]₀/[AIBN]₀ = 300/200/1/1

Figure S7. (a) Number-average molecular weights (Mn) and molecular weight distributions (Mw/Mn) of the copolymers from thermal-induced and Xanthate (EXEP)-mediated RAFT copolymerization of MI (M) and VAc (V) at 60 °C using HFIP as solvent. [VAc]₀/[MI]₀/[EXEP]₀ = 200/(200, 300, 133)/1. GPC traces: [VAc]₀/[MI]₀ = (b) 200/200, (c) 200/300, (d) 300/200. The unit of all the molecular weight showing in the GPC traces graph is g mol⁻¹. Reaction conditions are the same as Figure S5.
Figure S8. (a) Number-average molecular weights ($M_n$) and molecular weight distributions ($M_w/M_n$) of the copolymers thermal-induced and Xanthate (EXEP) mediated RAFT copolymerization of MI (M) and VAc (V) at 60 °C respectively using Dioxane as solvent. $[\text{VAc}]_0/[\text{MI}]_0$/[EXEP]$_0$/[AIBN]$_0 = 200/(200, 300, 133)/1$. GPC traces: $[\text{VAc}]_0/[\text{MI}]_0 = (b) 200/20$, (c) 200/300, (d) 300/200. Reaction conditions are the same as in Figure S7.

Figure S9. $^1$H NMR spectra of the samples obtained from blue light-induced RAFT copolymerization of MI (M) and VAc (V) at 25 °C respectively in HFIP (a) and in Dioxane (b). The feeding ratio of the copolymerization: $[\text{VAc}]_0/[\text{MI}]_0 = 300/200$. Reaction conditions are the same as in Figure S3.
Figure S10. $^1$H NMR spectra of the samples obtained from blue light-induced RAFT copolymerization of MI (M) and VAc (V) at 25 °C respectively in HFIP (a) and in Dioxane (b). The feeding ratio of the copolymerization: $[\text{VAC}]_0/\text{[MI]}_0 = 200/300$.

Figure S11. Cumulative ($F_{\text{cum}}$) or instantaneous ($F_{\text{inst}}$) monomer contents of VAc in copolymers as a function of normalized chain length. The calculation formulas of $F_{\text{cum}}$, $F_{\text{inst}}$ and normalized chain length are demonstrated in Eqn. S1. All the products were obtained from RAFT copolymerization of MI (M) and VAc (V) at 25 °C respectively using HFIP or 1, 4-dioxane as solvent. Feeding ratio is $[\text{VAC}]_0/\text{[MI]}_0/[\text{EXEP}]_0 = 600/200/2$.

Table S1. Data for the comparison with cumulative monomer contents of VAc in copolymers calculated from Elemental analysis ($F_{\text{cum}}(\text{EA})$) and $^1$H NMR ($F_{\text{cum}}(\text{conv.})$) with different molecular weight.
