S1. General experimental remarks

All of the synthetic and polymerization experiments were conducted under an argon atmosphere. Toluene, diethyl ether, THF and triethylamine were refluxed with Na/benzophenone/dibenzo-18-crown-6 and distilled prior to use. Heptane was refluxed for 10 h over sodium and then distilled and stored under an argon atmosphere over sodium. Methanol was refluxed and distilled over magnesium methoxide. 2,6-Di-tert-butyl-4-methylphenol (BHT, Sigma-Aldrich, ≥99%), di-n-butylmagnesium (Sigma-Aldrich, 1.0 M solution in heptane), trimethylaluminium (Sigma-Aldrich, 1.0 M solution in toluene), diethylzinc (Sigma-Aldrich, 1.0 M solution in toluene), 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU, Sigma-Aldrich, 99%) and acetic acid (Acros, ≥99.9%) were used as purchased. Benzyl alcohol (Acros, 99%) was distilled over BaO and stored under argon. Mg(BHT)_2(THF)_2 (Mg2), Ca(BHT)_2(THF)_3 (Ca1), EtZn(BHT)(THF)_2 (Zn1), Me_2Al(BHT)(THF)_2 (Al1), 1,5,7-triazabicyclo[4.4.0]undec-5-ene (TBD), N-[3,5-bis(trifluoromethyl)phenyl]-N’-cyclohexyl thiourea (TU) were prepared according to the described methods.

CDCl₃ (Cambridge Isotope Laboratories, Inc., D 99.8 atom %) was used as purchased. THF-d₈ (Aldrich, ≥99.5 atom % ^2H) and toluene-d₈ (Aldrich, ≥99.6 atom % ^2H) were stored over sodium/benzophenone and condensed into NMR tubes using the Schlenk technique. The ¹H and ¹³C NMR spectra were recorded on a Bruker AVANCE 400 spectrometer (400 MHz) at 20 °C. The ¹H homodecoupling spectra were recorded on an Agilent 400-MR spectrometer (400 MHz) at 20 °C in CDCl₃. The chemical shifts are reported in ppm relative to the solvent residual peaks.

GPC measurements of the polymers were performed in DMF (containing 0.1 g/L lithium bromide as additive) with a flow rate of 1 mL/min at 50 °C using an Agilent PL-GPC 220 integrated instrument with an autosampler and RI-detector. Calibration was achieved using poly(ethylene glycol) standards.

Elemental analysis (C, H) was performed on a Perkin Elmer Series II CHNS/O Analyser 2400.

S2.1. Syntesis of BuMg(BHT)(THF)2 (Mg1)

BHT (0.22 g, 1 mmol) was placed into an ampoule filled with argon. Heptane (1 mL) was injected with a syringe through a septum. Upon ionol dissolution, the ampoule was cooled to -10 °C. Dibutylmagnesium (1 mL of 1 M in heptane, 1 mmol) was transferred into the ampoule while stirring the solution. After warming to room temperature and stirring for 4 h, the as-formed crystals were washed with 2 mL of heptane and dried under vacuum. The obtained solid was dissolved in THF (2 mL). The resulting solution was evaporated under reduced pressure to a residual volume of 0.5 mL. The as-formed crystalline precipitate was filtered, washed with 1 mL of a 1:1 (v/v) THF/heptane mixture, and dried under vacuum. The yield was 0.38 g (86 %).

A solution Bu₂Mg in heptane (20 mL, 1 M, 20 mmol) was dropwise added to a stirred solution of BHT (4.410 g, 20 mmol) in a toluene/THF mixture (8 mL and 4.5 mL, correspondingly). After 40 min, a solution of PhCH₂OH (2.168 g, 20 mmol) in THF (1 mL) was dropwise added to the stirred reaction mixture. The formed solution was then stirred for 3 min. S4.1. Polymerization of $^{1}$PrOEP

Polymerization of $^{1}$PrOEP using Mg3 as the catalyst (Table 1, Run 3).

$^{1}$PrOEP (0.977 g, 5.88·10^{-3} mol) was introduced into a vial equipped with a magnetic stirrer and septum, 0.46 mL dry CH$_2$Cl$_2$ was added to $^{1}$PrOEP. A stock solution of Mg3 in dry THF (317 mg, 7.50·10^{-4} mol Mg in 8.2 mL solution) was prepared. The polymerization was started by rapid addition of the stock solution of 5 (0.4 mL solution, 7.31·10^{-5} mol Mg) to the stirred solution of $^{1}$PrOEP by a syringe to give a total reaction concentration of 2M $^{1}$PrOEP. The polymerization was terminated after the required time by the addition of an excess of acetic acid in CH$_2$Cl$_2$. The monomer conversion was determined using $^{31}$P NMR spectroscopy by integration of the monomer (δ 16.7 ppm) and polymer (δ –2.15 ppm) resonance signals.
