1. General Methods.

The starting materials were purchased and used without further purification. Unless otherwise noted, reactions were carried out under an argon atmosphere. For Column chromatography, 200-300 mesh silica gel was employed and preparative TLC (PTLC). Analytical TLC was performed with silica gel GF254 plates. $^1$H NMR (400 MHz) and $^{13}$C NMR (100 MHz) were recorded in CDCl$_3$ using TMS as internal standard. All products and were further characterized by high resolution mass spectra (HRMS, FTMS, ESI full ms [100-2000]); copies of their $^1$H NMR and $^{13}$C NMR spectra are provided.
2. Synthesis of compound 2a, 2m, 2n, 2o, 2p

\[ \text{K}_2\text{CO}_3 \xrightarrow{\text{Br}_2} \text{K}_2\text{Br} + \text{Br}^- \]

2a, 2m was synthesized according to the previous literatures, the residue was distilled under vacuum distillation to give product 2a, 2m. The NMR spectroscopy and GC-MS data were in full accordance with the data in the reported literatures.¹

2-(2-bromoethyl)spiro[4.4]nonan-1-one (2n)

A mixture of ethyl 2-oxocyclopentanecarboxylate (50 mmol), potassium carbonate (100 mmol) and 1,4-dibromobutane (200 mmol) was dissolved in acetone (100 mL) and heated at 65 °C for 20 h, The suspension was filtered, the filtrate was concentrated and the residue was purified with chromatography column on silica gel to afford the ethyl 1-(4-bromobutyl)-2-oxocyclopentane-1-carboxylate.¹
Ethyl 1-(4-bromobutyl)-2-oxocyclopentane-1-carboxylate (40 mmol) was dissolved in hydrobromic acid (48%, 80 mL) and the solution was heated at 110 °C for 18 h until the evolution of carbon dioxide ceased. The solution was cooled to room temperature, diluted with water (70 mL) and extracted with EtOAc (120 mL). The aqueous phase was neutralised with solid sodium hydrogen carbonate and again extracted with diethyl ether. The combined organic phases were washed with a saturated solution of sodium hydrogen carbonate (100 mL), dried (Na$_2$SO$_4$), filtered and concentrated. The residue was purified with chromatography column on silica gel to afford the 2-(4-bromobutyl)cyclopentan-1-one.

A mixture of 2-(4-bromobutyl)cyclopentan-1-one (30 mmol), KOH (60 mmol) was dissolved in MeOH (60 mL) and heated at 65 °C overnight. After removing the solvent by reduced pressure distillation, diluted with water. The mixture was extracted with ethyl ether and the combined organic layers were washed with saturated brine, dried over Na$_2$SO$_4$. The solvent was removed under vacuo, and the residue was purified with chromatography column on silica gel to afford the spiro[4.4]nonan-1-one.

NaH (60 mmol) was added slowly in diethyl carbonate (60 mL). The mixture was heated at 130 °C for 30 min, and then cooled to 90 °C. A solution of the spiro[4.4]nonan-1-one (20 mmol) in diethyl carbonate (10 mL) was added dropwise from the needle over 2 h. After the addition,
the mixture was stirred at 90 °C overnight. When the reaction was cooled to room temperature, glacial acetic acid (10 mL) was added dropwise and a heavy, pasty solid appeared. Ice-water was added until the solid was dissolved completely. The organic layer was separated, and the water layer was extracted with EtOAc (3 × 50 mL). The combined organic solution was washed with water (100 mL) and brine (100 mL), then dried over Na₂SO₄. The mixture was distilled under reduced pressure or subjected chromatography to give ethyl 1-oxospiro[4.4]nonane-2-carboxylate.

2m was synthesized via two step from ethyl 1-oxospiro[4.4]nonane-2-carboxylate according to the method of synthesizing 2a. The residue was purified with chromatography column (Petroleum ether/EtOAc =20:1).

The mixture was stirred overnight. The ice-water was added, and extracted with ethyl acetate (120 mL). The combined organic phases were washed with a saturated solution of sodium hydrogen carbonate (100 mL), dried (Na\(_2\)SO\(_4\)), filtered and concentrated. The residue was purified with chromatography column on silica gel to afford the ethyl-1-(2-bromoethyl)-3,3-dimethyl-2-oxocyclopentane-1-carboxylate.

Ethyl-1-(2-bromoethyl)-3,3-dimethyl-2-oxocyclopentane-1-carboxylate (30 mmol) was dissolved in hydrobromic acid (48%, 60mL) and the solution was heated at 110 °C for 18 h until the evolution of carbon dioxide ceased. The solution was cooled to room temperature, diluted with water (70 mL) and extracted with diethyl ether (120 mL). The aqueous phase was neutralised with solid sodium hydrogen carbonate and again extracted with diethyl ether. The combined organic phases were washed with a saturated solution of sodium hydrogen carbonate (100 mL), dried (Na\(_2\)SO\(_4\)), filtered and concentrated.
