**Fig. S1** Percentage of change of UV-visible transmittance of functionalized silica deposited surface after outdoor tests. (Percentage of Transmittance Change = \((T_{AT} - T_o)/T_o\), where To is the average transmittance prior to the outdoor tests and TAT is the average transmittance after the outdoor tests.)
S1. Analysis for force balance of immersing dust particle into silicone oil

Consider oil impregnated film and immersion of spherical dust particles takes place along the depth $h$ be in line with Fig. S2.

![Diagram of partially immersed spherical particle and forces acting on a particle. The blue region represents oil.](image)

**Fig. S2** Partially immersed spherical particle and forces acting on a particle. The blue region represents oil.

Geometric variables $r$, $L$, and $a$ can be defined through Fig. S2. The volume of a dust particle ($V_{total}$) and volume displaced by fluid ($V_{displaced}$) can be determined from Fig. S2, i.e.: consider the followings:

\[ L = 2\pi a \tag{S1} \]

where $L$ is the interfacial length (contact length) between particle and oil surface.

Total volume of the spherical particle is:

\[ V_{total} = \frac{4\pi}{3}r^3 \tag{S2} \]

where $r$ is radius of the spherical particle. The volume displaced of oil due to particle immersion is:
\[ V_{\text{displaced}} = \left( \frac{\pi}{3} \right) h^2 (3r - h) \]  \hspace{1cm} (S3)

Geometric relations can be obtained from Fig. S2, i.e., the following expression can be written:

\[ a = \sqrt{r^2 - (r - h)^2} \]  \hspace{1cm} (S4)

Vertical force acting on a spherical particle yields force balance, i.e.,

\[ F_{\text{Resultant}} = F_B + F_\gamma \sin \theta - W \]  \hspace{1cm} (S5)

where, \( F_B \) \((F_B = \gamma_{\text{fluid}} V_{\text{displaced}})\) is the buoyancy force, \( F_\gamma \) \((F_\gamma = \sigma L)\) is the surface tension force, \( \sigma \) is surface tension, and \( W \) \((W = \gamma_{\text{particle}} V_{\text{total}})\) is the weight of spherical particle.

From force balance one can derive an expression for displacement \((h)\), for which spherical dust particle immerses into oil, in terms of time \((t)\). In this case, force balance yields:

\[ \sum F = F_{\text{Resultant}} = ma \]  \hspace{1cm} (S6)

Here the positive direction is taken upward.

Let mass of spherical particle is \((ma = \rho V_{\text{total}} (d^2 h/dt^2))\), where \( \rho \) is density of particle. After substituting vertical force balance in Eq. S6, it yields:

\[ \rho V_{\text{total}} (d^2 h/dt^2) = F_B + F_\sigma \sin \theta - W \]  \hspace{1cm} (S7)

Substituting the expressions of forces from above, one can obtain:
\[ \rho V_{\text{total}}(d^2 h/dt^2) = \gamma_{\text{fluid}} V_{\text{displaced}} + \sigma L \sin \theta - \gamma_{\text{particle}} V_{\text{total}} \]  
\[ \text{(S8)} \]

where \( L = 2\pi a \) and \( a = \sqrt{r^2 - (r - h)^2} \).

Substituting expression for volume and length, which are all functions of \( h \), one can get:

\[ \rho (4\pi/3)r^3(d^2 h/dt^2) = \left\{ \gamma_{\text{fluid}} \left(\frac{\pi}{2}\right) h^2 (3r - h) + \sigma \sin \theta 2\pi \sqrt{r^2 - (r - h)^2} \right\} - \gamma_{\text{particle}} (4\pi/3)r^3 \]  
\[ \text{(S9)} \]

Rearranging and expanding the right side of Eq. S9, it yields:

\[ \frac{d^2 h}{dt^2} = -\gamma_{\text{fluid}} \frac{1}{4\rho r^3} h^3 + \frac{3}{4\rho r^2} \gamma_{\text{fluid}} h^2 + \frac{3}{2\rho r^3} \sigma \sin \theta \sqrt{r^2 - (r - h)^2} - \gamma_{\text{particle}} \frac{1}{\rho} \]  
\[ \text{(S10)} \]

Eq. S10 is a nonlinear second-order ordinary differential equation. Eq. S10 can be solved numerically after introducing the appropriate initial conditions, such as at \( t = 0 \Rightarrow h = 0 \) and \( dh/dt = 0 \).
