All solvents used were of technical grade.

2. **Characterization**

Thin-layer chromatography (TLC) identification of reactants and products was performed on silica-gel-coated aluminum foil (Aldrich, silica gel 60, F 254 with fluorescence indicator). Compounds were visualized by Seebach reagent (mixture of phosphomolybdc acid, cerium(IV) sulfate, water and sulfuric acid).

NMR spectra were recorded on a Bruker AVANCE DPX spectrometer (measuring frequency: \(^1\)H NMR = 300 MHz, \(^{13}\)C NMR = 75 MHz) or a Bruker AMX R 500 spectrometer (measuring frequency: \(^1\)H-NMR = 500 MHz, \(^{13}\)C NMR = 126 MHz). NMR spectra were obtained using CDCl\(_3\). All \(^1\)H NMR spectra are reported in ppm relative to the solvent signal for CDCl\(_3\) at 7.26 ppm, \(^{13}\)C NMR spectra are reported relative to the solvent signal for CDCl\(_3\) at 77.16 ppm.
Polymers were characterized on a SEC System LC-20A (Shimadzu) equipped with a SIL-20A autosampler and a RID-10A refractive index detector using THF (flow rate 1 mL/min) at 50 °C. The analysis was performed on the following column system: analytical main-column PSS SDV (5 μm, 300 mm × 8.0 mm, 10,000 Å) with a PSS SDV analytical precolumn (5 μm, 50 mm × 8.0 mm). For the calibration, narrow linear poly(methyl methacrylate) standards (Polymer Standards Service PPS, Germany) ranging from 1.1 to 981 kDa were used. FAB (fast atom bombardment) mass spectra were recorded on a MAT95 (Finnigan) instrument. Infrared (IR) spectra were recorded on a Bruker alpha-p instrument applying KBr- as well as ATR-technology.

Particle size ($d_{DLS}$) was obtained using a dynamic light scattering (DLS) instrument (Malvern Instruments, Zeta Sizer Nano S) with a scattering angle of 176.1°. The reported diameter is an intensity-weighted average particle size ($z$-average), comprised of five to nine measurements analyzed in ten to 20 runs. The reported polydispersity index values ($PD_{DLS}$) are those given by the instrument and are not conventional PDI values. These $PD_{DLS}$ values are referred to as Malvern polydispersity.

A UV/VIS spectrometer of the type Cary 60 from Agilent Technologies was used to record UV/VIS spectra.

11. Notes and references

\[ M_n = M_n(\text{Monomer 3 + tert – butyl isocyanide 5}) \times n \times m + M_n(\text{ITCA 4}) \]

**Formula S1:** Formula to calculate the molecular weight of the star-shaped homopolymers by the number of monomer units \( n \) and the number of arms \( m \).

Representative example with **P1**:

\[ M_n = \left( 274.42 \, \frac{g}{\text{mol}} + 83.13 \, \frac{g}{\text{mol}} \right) \times 20 \times 3 + 210.14 \, \frac{g}{\text{mol}} = 21663 \, \frac{g}{\text{mol}} \]
