General comments:

All chemicals were purchased from Aldrich Chemicals and used without further purification. Solvents were dried using an Innovative Technologies Solvent Purification System. Thin layer chromatography (TLC) was performed using Teledyne Silica gel 60 F254 plates and viewed under UV light. Column chromatography was performed using Silicycle Ultra-Pure Silica Gel (230 – 400 mesh). The solvents were dried and distilled prior to use. NMR spectra were recorded on Bruker Advance 500 locked to the deuterated solvent operating at 500 MHz. Mass spectra were performed on a Micromass LCT electrospray ionization TOF spectrometer. Solutions with concentrations of 0.001 molar were prepared in methanol and injected for analysis at a rate of 5 µL/min using a syringe pump. UV/Visible spectra were obtained on a Varian Cary 50 UV/vis Spectrophotometers. Fluorescence spectra were obtained on a Varian Cary Eclipse fluorescence spectrophotometer. All single crystal X-ray data were collected on a Bruker APEX diffractometer with a CCD detector operated at 50 kV and 30 mA with MoKα radiation. Crystals were frozen in paratone oil inside a cryoloop and reflection data were integrated from frame data obtained from hemisphere scans. Compounds 3,6-bis(phenyl)-1,2-diaminobenzene,1,2,4,7-triphenylbenzimidazole,1,2,4,7-triphenylbenzimidazolium tetrafluoroborate [1-H][BF₄],2 and bis(5-hydroxymethyl-m-phenylene)[26]crown-8,3 were synthesized using reported literature methods.

**Synthesis of Bis(5-bromomethyl-m-phenylene)[26]crown-8, (3)**

Phosphorus tribromide (1.0 M in dichloromethane, 29.5 mL, 29.5 mmol) was slowly added to a stirring mixture of bis(5-hydroxymethyl-m-phenylene)[26]crown-8 (2) (2.5 g, 4.92mmol), diethyl ether (250 mL), and ethyl acetate (30 mL). After stirring for 24 h at room temperature, to the mixture was added CH₂Cl₂ (50 mL) and then the solution carefully poured on to ice-water (100 g). The organic phase was separated, washed with saturated sodium bicarbonate solution (x1) and brine (x1). After drying over anhydrous sodium sulphate, the solvent was removed on a rotary evaporator. The oily residue solidified after the addition of ethyl acetate (10 mL). The solid was collected by filtration, rinsed with ether and air dried. Yield: 3.10 g, 99%. Mp 129–131 °C. The product was utilised in the next step without further purification.

Synthesis of (4)

Sodium hydride (60% in mineral oil, 19 mg, 0.473 mmol) was added to a Schlenk flask under nitrogen atmosphere. After addition of a small amount of THF (5 mL), a solution of 3-buten-1-ol (34 mg, 0.473 mmol) in THF (2 mL) was added dropwise to the mixture. After cessation of bubbling, the mixture was allowed to stir for 1 h at room temperature. A solution of 3 (100 mg, 0.158 mmol) in THF (15 mL) was then introduced to the mixture in portions by syringe. The mixture was further stirred at room temperature for 2 days and quenched by carefully addition of water dropwise. After ethyl acetate (15 mL) and brine (20 mL) were added, the organic layer was separated and dried over anhydrous magnesium sulphate. Removal of the solvent gave a viscous oil which was purified by column chromatography (SiO₂, ethyl acetate/hexane= 1:1). Colorless oil. Yield: 89 mg, 91%. ¹H NMR (500 MHz, CDCl₃, 298 K) δ = 6.49 (s, 4H), 6.42 (s, 2H), 5.82 (m, 2H), 5.08 (m, 4H), 4.42 (s, 4H), 4.08 (m, 8H), 3.85 (m, 8H), 3.73 (s, 8H), 3.48 (t, 4H, J = 4.8 Hz), 2.36 (q, 4H, J = 4.8 Hz). ¹³C NMR (125 MHz, CDCl₃, 298 K) δ = 160.1, 141.0, 138.4, 114.7, 106.2, 100.9, 72.8, 71.0, 69.7, 69.6, 67.4, 31.3. Synthesis of (5)

This compound was prepared according to the procedure used for compound 4. Sodium hydride (60% in mineral oil, 640 mg, 16 mmol) was added to a Schlenk flask (250 mL) under an N₂ atmosphere. After addition of a small amount of THF (10 mL), a solution of 4-penten-1-ol (1.38 g, 16 mmol) in THF (20 mL) was added dropwise to the mixture. After cessation of bubbling, the mixture was allowed to stir for 1 h at room temperature. A solution of 3 (2.54 g, 0.158 mmol) in THF (60 mL) was then introduced to the mixture in portions via syringe. The mixture was further stirred at room temperature for 1 day and
quenched by carefully adding water dropwise. After ethyl acetate (150 mL) and brine (150 mL) were added, the organic layer was separated and dried over anhydrous magnesium sulphate. Removal of the solvent gave a viscous oil which was purified by column chromatography (SiO$_2$, ethyl acetate/hexane = 1:1). Yield: 1.84 g, 71%. $^1$H NMR (500 MHz, CDCl$_3$, 298 K) $\delta$ = 6.49 (s, 4H), 6.42 (s, 2H), 5.82 (m, 2H), 5.08 (m, 4H), 4.40 (s, 4H), 4.08 (m, 8H), 3.84 (m, 8H), 3.73 (s, 8H), 3.44 (t, 4H, $J = 4.8$ Hz), 2.13 (q, 4H, $J = 4.8$ Hz), 1.69 (m, 4H). $^{13}$C NMR (125 MHz, CDCl$_3$, 298 K) $\delta$ = 160.0, 141.0, 138.3, 144.7, 106.1, 100.9, 72.8, 71.0, 69.7, 69.6, 67.4, 30.4, 29.0. X-ray Crystallography

**General**: Crystals were frozen in paratone oil inside a cryoloop under a cold stream of N\textsubscript{2}. X-ray intensity data were collected at 173(2) K using a Bruker APEX diffractometer equipped with an APEX area detector. The raw area detector data frames were reduced and corrected for absorption effects using the SAINT+ and SADABS programs\textsuperscript{54}. Final unit cell parameters were determined by least-squares refinement taken from the data set. Diffraction data and unit-cell parameters were consistent with the assigned space groups. The structures were solved by direct methods with SHELXT\textsuperscript{55}. Subsequent difference Fourier calculations and full-matrix least-squares refinement against |F\textsuperscript{2}| were performed with SHELXL-2014\textsuperscript{55} using OLEX2.\textsuperscript{56} All non-hydrogen atoms were refined anisotropically and hydrogen atoms placed in idealized positions and refined using a riding model. See Table S1 for a summary of data collection, solution and refinement details. Complete details of the structures can be obtained from the Cambridge Crystallographic Data Centre at www.ccdc.cam.ac.uk for CCDC accession numbers 1533271 and 1533272.

**X-ray structure of Suitane 6a**

Single crystals were obtained from slow evaporation of a methanol/H\textsubscript{2}O solution of 6a. Crystals of formula 6a(CH\textsubscript{3}OH)\textsubscript{2} were of good quality. Data was collected using MoK\textsubscript{\alpha} radiation (\(\lambda = 0.71073 \text{\AA}\)). The asymmetric unit contained one molecule of the suit[1]ane (C\textsubscript{59}H\textsubscript{68}N\textsubscript{2}O\textsubscript{10}) and two molecules of CH\textsubscript{3}OH. The structure was solved in the monoclinic space group P2\textsubscript{1}/n (#14). A portion of one of the polyether chains was disordered and restrained with the SAME command and modelled with occupancies of 58:42 using PART and FVAR. See Table S1 for details.

**X-ray structure of Suitane 6b**

Single crystals were obtained from slow evaporation of an acetonitrile/H\textsubscript{2}O solution of 6b. Crystals of formula 6b(CH\textsubscript{3}CN) were of good quality. Data was collected using MoK\textsubscript{\alpha} radiation (\(\lambda = 0.71073 \text{\AA}\)). The asymmetric unit contained one molecule of the suit[1]ane (C\textsubscript{59}H\textsubscript{68}N\textsubscript{2}O\textsubscript{10}) and one molecule of CH\textsubscript{3}CN. The structure was solved in the orthorhombic space group Pbca. A portion of one of the polyether chains and the alkane chain were disordered and restrained with SAME & SIMU commands and modelled with occupancies of 60:40 and 82:18 respectively using PART and FVAR. See Table S1 for details.
