1. General Information

All reactions were carried out in a sample vial (4 mL) equipped with a Teflon-coated magnetic stir bar. HPLC grade water was degassed by sparging with argon prior to use. Solutions of 3.0 wt % Nok and other surfactants in degassed water were made and stored in a glass container with a septum on the bench-top. HandaPhos ligand was synthesized according to the original procedures.\(^1\) Gold pre-catalyst was prepared by procedures below and stored in a dry box prior to use. Starting materials were prepared applying reference procedures. Column chromatography was carried out using Silica gel 60 (230 – 400 mesh). TLC analysis was done using TLC Silica gel 60 F\(_{254}\) glass plates. \(^1\)H and \(^{13}\)C NMR spectra were obtained in CDCl\(_3\) using 400 MHz, 500 MHz or 600 MHz NMR spectrometer. High-resolution mass spectral analyses were obtained using a double-focusing magnetic sector instrument for EI and a quadrupole/TOF instrument (API) for ESI.

2. Experimental Procedures

**Preparation of gold pre-catalyst**

\((\text{HandaPhos})\text{Au(I)}\) chloride. \((\text{tetrahydrothiophene})\text{gold(I)}\) chloride was generated from tetrahydrothiophene and auric acid according to a known procedure.\(^2\) A 10 mL round-bottom flask equipped with a Teflon-coated magnetic stir bar and septum was charged with HandaPhos (27.3 mg, 0.05 mmol) and \((\text{tetrahydrothiophene})\text{gold(I)}\) chloride (16.0 mg, 0.05 mmol). A rubber septum was added to the flask, which was degassed and filled with argon. The flask was covered with aluminum foil to protect it from light. Anhydrous dichloromethane (2 mL) was added via syringe and the reaction was stirred for 2 h. After, the solvent was removed under vacuum, the product was put under high vacuum overnight to remove trace amounts of solvent and tetrahydrothiophene. A white solid was obtained (35.0 mg, 90%). \(^1\)H NMR (400 MHz, CDCl\(_3\)) \(\delta\) 7.53 (dd, \(J = 11.8, 4.3\) Hz, 1H), 7.38 (t, \(J = 8.4\) Hz, 1H), 7.01 (s, 2H), 6.91 (ddd, \(J = 7.4, 4.8, 2.6\) Hz, 2H), 6.72 (d, \(J = 8.4\) Hz, 1H), 6.58 (d, \(J = 8.4\) Hz, 1H), 4.95 (dd, \(J = 10.3, 3.7\) Hz, 1H), 3.88 (s, 3H), 3.70 (d, \(J = 7.6\) Hz, 3H), 3.30 – 3.20 (m, 2H), 2.92 (ddt, \(J = 37.3, 13.8, 6.8\) Hz, 3H), 1.53 (s, 2H), 1.25 (dd, \(J = 9.0, 3.5\) Hz, 12H), 1.18 (d, \(J = 6.8\) Hz, 6H), 0.96 (d, \(J = 17.2\) Hz, 9H); \(^{13}\)C NMR (101 MHz, CDCl\(_3\)) \(\delta\) 163.23, 157.36, 157.08, 147.55, 147.12, 139.96, 134.26, 130.49, 128.32, 128.23, 125.65, 125.57, 121.24, 113.10, 111.68, 104.79, 103.21, 77.19, 55.84, 55.26, 34.72, 34.43, 34.09, 34.07, 33.94, 29.56, 25.95, 25.88, 24.77, 24.02, 23.93; \(^{31}\)P NMR (162 MHz, CDCl\(_3\)) \(\delta\) 59.97.

Gold pre-catalyst. HandaPhos-gold(I) chloride (0.8 mg, 0.001 mmol) and silver(I) hexafluoroantimonate (0.7 mg, 0.002 mmol) were charged under an argon atmosphere into a 5 mL microwave vial containing a Teflon-coated magnetic stir bar and a rubber septum. The vial was covered with aluminum foil to protect the compounds from light. Anhydrous dichloromethane (1 mL) was added via syringe and the reaction was stirred for 15-20 min prior to use.
General Procedures for ppm Au-catalyzed cycloisomerization of allenes

To a 4 mL glass vial equipped with Teflon-coated magnetic stir bar, 100 µL of gold pre-catalyst in DCM solution (1000 ppm or 0.1 mol %) was added and the DCM was removed in vacuo. Allene (0.1 mmol) was added to the vial followed by toluene (200 µL), 3 wt % Nok/H₂O (0.2 mL, 0.5 M), and trifluoroacetic acid (23 mg, 0.2 mmol). The resulting mixture was stirred at rt until completion. Thin-layer chromatography was used to follow the reaction. After completion, the product was exacted with EtOAc (3 x 0.1 mL) and the solvent was evaporated under vacuum. Crude product was purified via column chromatography using hexane/EtOAc to afford pure material.

1-(4-(Dimethylamino)phenyl)ethan-1-one (22)

Following the general procedure using 4-ethynyl-N,N-dimethylaniline (29.2 mg, 0.2 mmol), the reaction was allowed to stir for 22 h. After column chromatography, the product was obtained as a red solid (32.3 mg, 98%). mp 87-89 °C; \(^7^\) \(^1\)H NMR (600 MHz, CDCl\(_3\) \(\delta\) 7.84 (d, \(J = 9.0\) Hz, 2H), 6.62 (d, \(J = 9.0\) Hz, 2H), 3.03 (s, 6H), 2.48 (s, 3H). \(^8^\)

Recycle study (Figure 8)

1\(^{st}\) reaction

Followed the general procedure of hydration using 4-methyl-N-(prop-2-yn-1-yl)benzenesulfonamide (105.4 mg, 0.5 mmol), 500 \(\mu\)L of gold pre-catalyst in dichloromethane solution (1000 ppm or 0.1 mol %), toluene (500 \(\mu\)L), 3 wt % Nok/H\(_2\)O (0.5 mL, 1.0 M), and trifluoroacetic acid (114 mg, 1.0 mmol). The resulting mixture was stirred at rt for 24 h. After completion, the product was exacted with EtOAc (3 x 0.1 mL) and the solvent was evaporated under vacuum. Crude product was purified via column chromatography using hexane/EtOAc and pure product was obtained (106.9 mg, 93%). The aqueous phase containing the remaining
surfactant and catalyst is reused by addition of new substrate, toluene, and TFA to start the next cycle.

**1st recycle**

![Chemical structure](image1.png)

To a remaining aqueous phase containing catalyst and surfactant, 1,2-diphenyldec-3-yne-1,2-diol (160.0 mg, 0.5 mmol) was added into the reaction vial followed by addition of toluene (500 µL), and trifluoroacetic acid (114 mg, 1.0 mmol). The reaction was stirred for 15 mins after TLC confirmed completion. Product was obtained by in-flask extraction with EtOAc and the solvent was evaporated under vacuum. Crude product was purified via column chromatography using hexane/EtOAc and pure product was obtained (139.0 mg, 92%).

**2nd recycle**

![Chemical structure](image2.png)

To a remaining aqueous phase, deca-3,4-dien-1-ol (75.5 mg, 0.5 mmol) was added into the reaction vial followed by addition of toluene (500 µL), and trifluoroacetic acid (114 mg, 1.0 mmol). Additional catalyst of 500 ppm (500 µL, 500 ppm) was added to catalyze the third reaction. The reaction was stirred for 24 h after TLC confirmed completion. Product was obtained by in-flask extraction with EtOAc and the solvent was evaporated under vacuum. Crude product was purified via column chromatography using hexane/EtOAc and pure product was obtained (68.5 mg, 91%).

**3rd recycle**

![Chemical structure](image3.png)

To a remaining aqueous phase, $N$-(2,2-diphenylhexa-4,5-dien-1-yl)-4-methylbenzenesulfonamide (184.6 mg, 0.5 mmol) was added into the reaction vial followed by addition of toluene (500 µL), and trifluoroacetic acid (114 mg, 1.0 mmol). Additional catalyst (500 µL, 500 ppm...
ppm) was added to catalyze the forth reaction. The reaction was stirred for 24 h after TLC confirmed completion. Product was obtained by in-flask extraction with EtOAc and the solvent was evaporated under vacuum. Crude product was purified via column chromatography using hexane/EtOAc and pure product was obtained (182.8 mg, 99%).

**Calculation of E Factor**

Following the general procedure of cycloisomerization of allenes using methyl 5-cyclohexylidene-2-hydroxy-2-phenylpent-4-enoate (28 mg, 0.1 mmol), the reaction was allowed to stir for 24 h. After completion, the product was obtained by extraction with EtOAc (200 µL, 180.4 mg) and crude product was purified by column chromatography. After column chromatography, the product was obtained as a colorless liquid (26 mg, 91%).

\[
E \text{ Factor} = \frac{\text{total of organic wastes (kg)}}{\text{product (kg)}}
\]

\[
= \frac{\text{toluene (co-solvent) + EtOAc (extraction)}}{\text{isolated pure product}}
\]

\[
= \frac{17.3 \text{ mg} + 180.4 \text{ mg}}{26 \text{ mg}}
\]

\[
= 7.6
