1. General information

1.1 Materials

All reagents were acquired as reagent grade and used without further purification. Solvents for RP-HPLC were purchased as RP-HPLC grade and used without further purification. Unless mentioned, all organic chemistry experiments were executed under an oxygen-free atmosphere of nitrogen using standard techniques.

6-Chloro-1-hydroxybenzotriazole (6-Cl-HOBt), Fmoc-Gly-Thr(ψ<sub>Me,Me</sub>pro)-OH, Fmoc-Tyr(tBu)-Ser(ψ<sub>Me,Me</sub>pro)-OH, and Fmoc-Ser(tBu)-Ser(ψ<sub>Me,Me</sub>pro)-OH were purchased from Aapptec (Louisville, Kentucky). 2-(7-Aza-1H-benzotriazole-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate (HATU), O-(6-chlorobenzotriazol-1-yl)-N,N',N''-tetramethyluronium hexafluorophosphate (HCTU), 1-hydroxy-7-azabenzotriazole (HOAt), 2-chlorotrityl chloride resin, and S-trityl-3-mercaptopropionic acid were purchased from GL Biochem (Shanghai, China). N,N-diethylformamide (DMF) (AR grade), and acetonitrile (CH<sub>3</sub>CN) [high-performance liquid chromatography (HPLC) grade] were purchased from Scharlau (Barcelona, Spain). N,N'-diisopropylethylamine (iPr<sub>2</sub>EtN), triisopropylsilane (iPr<sub>3</sub>SiH), 2,2'-(ethylenedioxy)-diethanethiol (DODT), N,N'-diisopropylcarbodiimide (DIC), N,N-dimethylaminopyridine (DMAP), 2,2,2-trifluoroethanol (TFE), 1,2-ethanedithiol (EDT), formic acid, 2,2,6,6-tetramethylpyridine (TMP), 4-mercaptopentanoylacetic acid (MPAA), tris(2-carboxyethyl)hydrochloride (TCEP.HCl), guanidine hydrochloride (Gn.HCl), 4-(2-hydroxyethyl)-1-piperazineethanesulfonic acid (HEPES), tetrabutylammonium iodide (TBAI), methoxyamine.HCl, p-cresol, dimethyl sulfide (Me<sub>2</sub>S), (ethylenedinitrilo)tetraacetic acid (EDTA), benzyl mercaptan, hydrazine hydrate, 2-mercaptoethanol, L-cysteine, L-cystine, and Fmoc-Ser-OH were purchased from Sigma–Aldrich (Sydney, Australia). Aminomethyl polystyrene resin (AM-PS) was purchased from Rapp Polymere (Tuebingen, Germany). Dichloromethane (CH<sub>2</sub>Cl<sub>2</sub>) was purchased from ECP Limited (Auckland, New Zealand). Boc-Lys(2-CI-Z)-PAM (Z = benzoyloxycarbonyl; PAM = phenylacetamidomethyl) was purchased from PolyPeptide Laboratories Group (Strasbourg, France). Diethyl ether (Et<sub>2</sub>O) was purchased from Avantor Performance Materials. Trifluoroacetic acid (TFA) was purchased from Halocarbon (River Edge, USA). 4-(4-Hydroxymethyl-3-methoxyphenoxy)-butyric acid (HMPB linker) was purchased from NovaBioChem (Läuelfingen, Switzerland). Anhydrous hydrogen fluoride (HF) was purchased from Matheson Trigas (Basking Ridge, New Jersey).

The following Fmoc-amino acids were purchased from GL Biochem: Fmoc-Gly-OH, Fmoc-Ala-OH, Fmoc-Met-OH, Fmoc-Phe-OH, Fmoc-Ile-OH, and Fmoc protected amino acids with the following side-chain protection: Fmoc-Tyr(tBu)-OH (tBu = tert-butyl), Fmoc-Asp(tBu)-OH,
Fmoc-Ser(tBu)-OH, Fmoc-Thr(tBu)-OH, Fmoc-Cys(Trt)-OH (Trt = triphenylmethyl), Fmoc-His(Trt)-OH, Fmoc-Lys(Boc)-OH.

The following Boc-amino acids were purchased from PolyPeptide laboratories: Boc-Pro-OH, Boc-Ala-OH, Boc-Leu-OH.H₂O, Boc-Met(O)-OH, Boc-Thz-OH (Thz = thiazolidine), and Boc protected amino acids with the following side-chain protection: Boc-Lys(2-CL-Z)-OH, Boc-Tyr(2-Br-Z)-OH, Boc-Trp(CH0)-OH (CHO = formyl), Boc-Cys(4-MeBn)-OH (Bn = benzyl), Boc-Thr(Bn)-OH.

1.2 TLC, HPLC, MS and NMR

Thin-layer chromatography (TLC) was performed with Merck silica gel plates using UV light as the visualising agent and/or developed using an ethanolic solution of vanillin. Analytical RP-HPLC spectra were performed on a Dionex (California, USA) Ultimate 3000 System equipped with a two-channel UV detector using the analytical column XTerra® MS C₁₈, 4.6 mm x 150 mm, 5 µm or Grace Vydac 219TP Diphenyl 4.6 x 250 mm, 5 µm and a linear gradient of either 5% to 75%B over 35 min or 5% to 65% over 30 min (ca. 2%B per minute) at a flow rate of 1 mL/min. The solvent system used was A (0.1% TFA in H₂O) and B (0.1% TFA in CH₃CN). The ratio of products was determined by integration of spectra recorded at 210 nm or 214 nm.

Peptides were purified using a Waters (Massachusetts, USA) S600E system using a semi-preparative column (Waters XTerra® C₁₈, 300 mm x 19 mm, 10 µm) at a flow rate of 10 mL/min and eluted using a one-step slow gradient protocol with detection at 210 nm. Fractions were collected, analysed by analytical RP-HPLC or ESI-MS, pooled and lyophilised.

Peptide masses were confirmed by a Bruker microTOF-Q II mass spectrometer (Bremen, Germany) or a Hewlett Packard (HP) 1100 series mass spectrometer (California, USA) using direct flow injection at 0.3 mL/min into an ESI source in the positive mode.

NMR experiments were performed at room temperature in CDCl₃ and CDCl₃/CD₃OD (v/v; 9:1) on a Bruker (Billerica, Massachusetts, U.S) BRX400 spectrometer operating at 400 MHz for ¹H nuclei and 100 MHz for ¹³C nuclei. ¹H-NMR spectra were recorded with 32768 data points and with spectral width of 15.9793 ppm. ¹³C-NMR spectra were recorded with 65539 data points and with spectral width of 238.8941 ppm. Spectra were analysed with Topspin (Bruker, Germany) software. Chemical shifts were reported in parts per million (ppm) on the δ scale downfield from tetramethylsilane as a reference. J Coupling constants were reported in Hertz (Hz). Multiplicities were reported as s = singlet, d = doublet, dd = doublet of doublets, ddd = doublet of doublets of doublets, t = triplet, and m = multiplet.
2 Synthesis of glycoside building blocks S6 and S11

Scheme 1. Synthesis of Fmoc-L-Ser(β-GlcNAc(OAc)_3)-OH S6 and Fmoc-L-Cys(β-GlcNAc(OAc)_3)-OH S11. Reagents and conditions: (i) acetyl chloride, r.t., 48 h, 70%; (ii) TMSOTf, 1,2-dichloroethane, reflux, 3 h, 68%; (iii) Anh. CuCl₂, 1,2-dichloroethane, reflux, 24 h, 44%; (iv) TFA:H₂O (9:1, v/v), r.t., 1 h, quant. for S6 and quant. for S11; (v) thiourea, acetone, reflux, 2 h; (vi) Na₂S₂O₅, CH₂Cl₂, H₂O, reflux, 3 h, 86% over 3 steps from S1; (vii) tetrabutylammonium sulfate, 5% aq. NaHCO₃:EtOAc (1:1, v/v), 50 °C, 3 h, 95%.
2.1 Synthesis of 2-acetamido-2-deoxy-3,4,6-tri-O-acetyl-1-chloro-\(\alpha\)-D-glucopyranose (S2)

\(\text{N-acetyl-\text{D-glucosamine (GlcNAc) S1 (5.0 g, 22.6 mmol) was dissolved in acetyl chloride (30 mL), the solution was sealed tight and stirred at room temperature for 2 days.}^4\) Upon completion of the reaction, as judged by TLC, the solution was diluted with \(\text{CH}_2\text{Cl}_2\) (80 mL) and transferred slowly into ice water (300 mL). The organic layer was separated and the aqueous phase was extracted with \(\text{CH}_2\text{Cl}_2\) (3 \(\times\) 50 mL). The organic layers were pooled and their pH was adjusted to 7.0 by the addition of saturated aq. \(\text{NaHCO}_3\). The combined organic extracts were then dried over sodium sulfate, filtered and concentrated \textit{in vacuo}. The crude product was purified by flash column chromatography on silica gel (EtOAc/petroleum ether, 1:1) to afford compound \(\text{S2 (5.8 g, 70\%) as a light brown solid.}^5\) \(\text{\textsuperscript{1}H NMR and \textsuperscript{13}C NMR data were in agreement with that reported in the literature.}^4,^5\)

\(\text{\textsuperscript{1}H NMR (400 MHz, CDCl}_3\):} \delta 6.19 (d, \(J\ 3.7 \text{ Hz, 1H, H-1}), 5.82 (d, \(J\ 8.7 \text{ Hz, 1H, H-2}), 5.35-5.30 (m, 1H, H-3), 5.24-5.19 (m, 1H, H-4), 4.57-4.51 (m, 1H, H-5), 4.31-4.25 (m, 2H, H-5, H-6\text{a}), 4.16-4.11 (m, 1H, H-6\text{b}), 2.06 (s, 6H, COC\text{H}_3), 2.06 (s, 3H, COCH\text{H}_3), 1.99 (s, 3H, COCH\text{H}_3); \text{\textsuperscript{13}C NMR (100 MHz, CDCl}_3\):} \delta 171.6, 170.7, 170.3, 169.3, 93.8, 71.1, 70.3, 67.2, 61.3, 53.6, 23.2, 20.8, 20.7.

2.2 tert-Butyl \(\text{N-(9-fluorenylmethoxycarbonyl)-L-serine (S4)}\)

\(\text{A mixture of DCC (3.78 g, 18.3 mmol) and a catalytic amount of freshly prepared Cu(I)Cl were added to freshly distilled (from calcium hydride) tert-butanol (1.76 mL, 18.3 mmol), and the mixture was stirred at room temperature for 5 days.}^6\) The reaction was then diluted with \(\text{CH}_2\text{Cl}_2\) (10 mL) followed by a dropwise addition of a solution of Fmoc-L-Ser-OH \(\text{S12 (1.50 g, 4.58 mmol) in THF/CH}_2\text{Cl}_2\) \(v/v; 1:9; 10\ mL). Upon completion of the reaction as judged by TLC (usually takes 3 h), the reaction was diluted with \(\text{CH}_2\text{Cl}_2\) (20 mL), then filtered, washed with saturated aq. \(\text{NH}_4\text{Cl (3 \(\times\) 20 mL), dried over sodium sulfate, and concentrated \textit{in vacuo}. The crude product was purified by flash column chromatography on silica gel (EtOAc/petroleum ether, 7:3) to afford alcohol \text{S4 (1.62 g, 94\%) as a white solid. The}^7\ \text{\textsuperscript{1}H NMR and \textsuperscript{13}C NMR data were in agreement with that reported in the literature.}^7\)
\textbf{1H NMR (400 MHz, CDCl}_3\textbf{):} \delta 7.75 (d, \ J 7.6 Hz, 2H, Fmoc-Ar), 7.55 (d, \ J 7.4 Hz, 2H, Fmoc-Ar), 7.39 (t, \ J 7.4 Hz, 2H, Fmoc-Ar), 7.31 (m, 2H, Fmoc-Ar), 4.41 (d, \ J 6.9 Hz, 2H, CH\textsubscript{2} Fmoc), 4.32 (s, 1H, CH Fmoc), 4.21 (t, \ J 6.92 Hz, 1H, CH\textsubscript{2} Ser), 4.18 (s, 9H, COOC(CH\textsubscript{3})\textsubscript{3}); \textbf{13C NMR (100 MHz, CDCl}_3\textbf{):} \delta 169.7, 156.5, 144.0, 143.9, 141.5, 127.9, 125.3, 120.2, 83.1, 67.4, 63.9, 56.8, 47.4, 28.2.

\section*{2.3 \textbf{N-}(9-fluorenlymethoxycarbonyl)-(2-acetamido-2-deoxy-3,4,6-tri-O-acetyl-\beta-D-glucopyranosyl)-L-serine (S6)}

\alpha-Cl-GlcNAc(OAc)\textsubscript{3} S2 (3.0 g, 7.71 mmol) was dissolved in anhydrous 1,2-dichloroethane (25 mL). Freshly distilled TMSOTf\textsuperscript{8} (2.8 mL, 15.4 mmol) was then added and the mixture was heated under reflux. Upon completion of the reaction as judged by TLC (usually 3 h), triethylamine was added to quench the residual TMSOTf and the solvent was removed \textit{in vacuo}. The crude product was purified by flash column chromatography on silica gel (CH\textsubscript{2}Cl\textsubscript{2}/MeOH, 99:1) to afford oxazoline S3 (1.70 g, 68\%) as a brown oil.

Oxazoline S3 (0.44 g, 1.33 mmol) was dissolved in 1,2-dichloroethane (15 mL) to which anhydrous CuCl\textsubscript{2} (0.18 g, 1.33 mmol) and Fmoc-Ser-OtBu S4 (1.02 g, 2 mmol) was added. The reaction mixture was then heated under reflux until completion of the reaction, as judged by TLC (usually 24 h). The reaction mixture was then cooled to room temperature, and the solvent was removed \textit{in vacuo}. The crude product was then diluted with EtOAc, and the organic layer was washed with 2 M HCl followed by saturated aq. NaHCO\textsubscript{3} (50 mL) and brine. Following the washing steps, the organic layer was dried over sodium sulfate, filtered and concentrated \textit{in vacuo} to yield the tert-butyl-protected glycoside S5 as an off-white solid (416 mg, 44\%).

The tert-butyl ester S5 (0.416 g, 0.58 mmol) was then treated with a mixture of trifluoroacetic acid and water (v/v; 9:1, 20 mL) at room temperature. Upon completion of the reaction, as judged by TLC (usually 1 h), the reaction mixture was concentrated \textit{in vacuo} followed by re-dissolving in toluene and evaporation which was repeated twice to remove traces of trifluoroacetic acid. The crude product was purified by flash column chromatography on silica gel (CH\textsubscript{2}Cl\textsubscript{2}/MeOH/AcOH, 94:5:1) to afford compound S6 (380 mg, quant.) as a white solid. The \textbf{1H NMR} and \textbf{13C NMR} data were in agreement with that reported in the literature.\textsuperscript{10}
HRESI-MS (EI): \( m/z \) [M+Na]+ calculated for C\( _{32}H_{36}N_2NaO_{13} \): 679.2217, found: 679.2110; \(^1\)H NMR (400 MHz, CDCl\(_3\)/CD\(_3\)OD (v/v; 9:1)): \( \delta \) 7.77 (d, \( J \) 7.5 Hz, 2H, Fmoc-Ar), 7.63 (d, \( J \) 7.1 Hz, 2H, Fmoc-Ar), 7.39 (t, \( J \) 7.5 Hz, 2H, Fmoc-Ar), 7.32 (m, 2H, Fmoc-Ar), 5.18 (t, \( J \) 9.7 Hz, 1H, H-3), 5.01 (t, \( J \) 9.4 Hz, 1H, H-4), 4.56 (d, \( J \) 8.3 Hz, 1H, H-1), 4.51-4.37 (m, 3H, CH\(_2\) Fmoc, CH\(_2\) Ser, CH\(_2\)b Fmoc), 4.26-4.10 (m, 4H, H-6\(_a\), CH Fmoc, CH\(_2\) Ser, H-6\(_b\)), 3.88-3.84 (m, 2H, CH\(_2\) Ser, H-2), 3.67 (ddd, \( J \) 9.9, 4.5, 2.4 Hz, 1H, H-5), 2.07 (s, 3H, COCH\(_3\)), 2.03 (s, 3H, COCH\(_3\)), 2.02 (s, 3H, COCH\(_3\)), 1.84 (s, 3H, COCH\(_3\)); \(^{13}\)C NMR (100 MHz, CDCl\(_3\)/CD\(_3\)OD (v/v; 9:1)): \( \delta \) 171.5, 170.7, 170.5, 169.2, 155.9, 143.3, 143.2, 140.8, 127.3, 126.7, 124.5, 119.5, 100.5, 71.9, 71.2, 68.8, 68.2, 66.3, 61.6, 53.9, 53.4, 46.7, 22.0, 20.1, 20.0.

2.4 tert-Butyl N-(9-fluorenylmethoxycarbonyl)-β-bromo-L-alanine (S9)

Fmoc-Ser-OtBu S4 (1.65 g, 4.30 mmol) was dissolved in CH\(_2\)Cl\(_2\) (90 mL) and cooled to 0 °C. To this solution, carbon tetrabromide (2.85 g, 8.61 mmol) and triphenylphosphine (2.26 g, 8.61 mmol) was then added. The reaction mixture was allowed to warm to room temperature, then stirred for 3 h and dried over sodium sulfate. The reaction mixture was then filtered and concentrated in vacuo to afford compound S9 (1.5 g, 78%) as a light brown solid which was used in the next step without further purification.
2.5 Synthesis of 2-acetamido-2-deoxy-3,4,6-tri-O-acetyl-1-thio-β-D-glucopyranose (S8)

α-Cl-GlcNAc(OAc)_3 S2 (4.0 g, 11.3 mmol) was dissolved in acetone (60 mL). To this solution, thiourea (1.5 g, 20.1 mmol) was added and the mixture heated under reflux for 2 h, after which a white precipitate was observed. The reaction was cooled to room temperature and the precipitate was filtered. The filtrate was repeatedly heated under reflux and filtered until the solid ceased to precipitate. The generated white solid S7 was used in the next step without further purification.

Thiourea S7 (4.5 g, 10.2 mmol) was dissolved in CH_2Cl_2/H_2O (v/v; 3:2, 50 mL). To this mixture, sodium metabisulfite (2.5 g, 12.7 mmol) was added and the reaction was heated under reflux for 3 h then cooled to room temperature. The organic phase was separated and the aqueous phase was extracted with CH_2Cl_2 (3 × 50 mL). The combined organic extracts were washed with brine (50 mL), water (50 mL) and dried over sodium sulphate, filtered and concentrated in vacuo. The crude product S8 (3.2 g, 86% over three steps from N-acetyl-D-glucosamine S1 was recovered as a white solid. 1H NMR and 13C NMR data were in agreement with that reported in the literature. 11

1H NMR (400 MHz, CDCl_3): δ 5.56 (d, J 9.6 Hz, 1H, H-1), 5.15-5.05 (m, 2H, H-3, H-4), 4.57 (dd, J 10.0, 9.5 Hz, 1H, H-2), 4.24 (dd, J 12.4, 4.8 Hz, 1H, H-6a), 4.14 (m, 1H, H-6b), 3.70-3.66 (m, 1H, H-5), 2.10 (s, 3H, COCH_3), 2.04 (s, 3H, COCH_3), 2.03 (s, 3H, COCH_3), 1.98 (s, 3H, COCH_3); 13C NMR (100 MHz, CDCl_3): δ 171.2, 170.7, 170.4, 169.2, 80.3, 76.3, 73.5, 73.5, 68.1, 62.1, 56.8, 23.3, 20.7, 20.6, 20.5.

2.6 N-(9-Fluorenylmethoxycarbonyl)-(2-acetamido-2-deoxy-3,4,6-tri-O-acetyl-β-D-glucopyranosyl)-L-cysteine (S11)

β-GlcNAc(OAc)_3-thiol S8 (1.60 g, 4.41 mmol) and bromide S9 (1.31 g, 2.94 mmol) in EtOAc (56 mL) were first added to a 5% (v/v) solution of NaHCO_3 in water (w/v; 56 mL). Tetrabutylammonium hydrogensulfate (4.0 g, 11.7 mmol) was then added and the mixture was stirred vigorously at 50 °C.
Upon completion of the reaction, as judged by TLC (usually 3 h), the organic phase was separated and the aqueous layer was extracted with EtOAc (3 × 50 mL). The combined organic layers were then washed with saturated aq. NaHCO₃ (50 mL), dried over sodium sulfate, filtered and concentrated in vacuo to yield the tert-butyl-protected glycoside S₁₀ as an off-white solid (2.03 g, 95%).

The protected thioglycoside S₁₀ (0.56 g, 0.77 mmol) was then treated with a mixture of TFA/H₂O (v/v; 9:1, 20 mL) at room temperature. Upon completion of the reaction, as judged by TLC (usually 1 h), the reaction mixture was concentrated in vacuo followed by re-dissolving in toluene and evaporation which was repeated twice to remove traces of trifluoroacetic acid. The crude product was purified by flash column chromatography on silica gel (CH₂Cl₂/MeOH, 95:5) to afford compound S₁₁ (0.51 g, 100%) as an off-white solid. The ¹H NMR and ¹³C NMR data were in agreement with that reported in the literature.

HRESI-MS (EI): m/z [M+Na]⁺ calculated for C₃₂H₃₆N₂O₁₇S: 695.1989, found: 695.1881; ¹H NMR (400 MHz, CDCl₃/CD₃OD (v/v; 9:1)): δ 7.77 (d, J 7.5 Hz, 2H, Fmoc-Ar), 7.66-7.60 (m, 2H, Fmoc-Ar), 7.41 (t, J 7.5 Hz, 2H, Fmoc-Ar), 7.35-7.31 (m, 2H, Fmoc-Ar), 5.14-5.03 (m, 2H, H-3, H-4), 4.68 (d, J 10.4 Hz, 1H, H-1), 4.56-4.49 (m, 1H, CHα Cys), 4.46-4.35 (m, 2H, CH₂ Fmoc), 4.26-4.22 (t, J 6.9 Hz, 1H, CH Fmoc), 4.19-4.15 (m, 2H, H-6a, H-6b), 4.09-4.04 (t, J 9.9 Hz, 1H, H-2), 3.68-3.66 (m, 1H, H-5), 3.35-3.30 (m, 1H, CH₃ Cys), 2.96-2.90 (m, 1H, CH₂ Cys), 2.06 (s, 3H, COCH₃), 2.03 (s, 3H, COCH₃), 2.02 (s, 3H, COCH₃), 1.86 (s, 3H, COCH₃); ¹³C NMR (100 MHz, CDCl₃/CD₃OD (v/v; 9:1)): δ 171.2, 171.0, 170.9, 169.4, 156.4, 143.6, 143.5, 141.0, 127.6, 126.9, 124.8, 119.8, 83.4, 75.6, 73.7, 68.4, 66.9, 62.1, 53.3, 52.5, 46.9, 31.9, 22.4, 20.3.

4. Peptide Synthesis

4.1 Synthesis of GccF (1b) and epi-GccF (1a), [D-27His]-GccF, using three fragments pathway

4.1.1 Synthesis of peptide 6

A mixture of Boc-Lys(2-Cl-Z)-PAM linker (166 mg, 0.4 mmol) and DIC (62 µL, 0.4 mmol) in CH₂Cl₂/DMF (v/v; 3 mL) was added to pre-swollen (CH₂Cl₂, 3 mL, 20 min) aminomethyl polystyrene resin (220.0 mg, 0.2 mmol, loading of 0.91 mmol/g). The reaction mixture was gently agitated at room temperature for 5 h, drained and washed with DMF (4 x 3 mL). A negative Kaiser test confirmed the coupling. The Boc group was then removed by 1 x 2 min treatment with TFA (6 mL) and thoroughly washed with DMF. To this H₂N-Lys(2-Cl-Z)-PAM linker resin was coupled Boc-Lys(2-Cl-Z)-OH (5.0 eq.) four times as part of a penta-lysine tag by Boc in situ neutralisation procedure, using 100% TFA as a deblocking reagent and HATU (4.75 eq.)/iPr₂EtN (8.0 eq.) as coupling reagents/base to yield peptidyl-resin S₁₃. To the deprotected H₂N-(Lys)₅-PAM linker resin S₁₃ was added a mixture of S-trityl-3-mercaptopropionic acid (139.4 mg, 0.4 mmol), HATU (140.7 mg, 0.37 mmol) and iPr₂EtN (139.4 µL, 0.8 mmol) in DMF (3 mL) and the reaction mixture was shaken at room temperature for 30 min. The resulting trityl-3-mercaptopropionic acid-(Lys)₅-PAM resin was used as a starting resin for polypeptide chain assembly. Trityl-protecting group was removed by treatment with TFA/iPr₂SiH/H₂O (v/v/v; 95:2.5:2.5) for 2 x 5 min to yield S₁₄. Elongation of peptide was then performed via the Boc in situ neutralisation procedure, as previously described, to yield peptidyl-resin S₁₅. Upon completion of the peptide assembly, the peptidyl resin was treated with 30 mM Me₂S and 30 mM TBAI in TFA for 2 min to effect a one-step reduction of methionine sulfoxide and Boc deprotection. The resin was then washed with DMF (4 x 8 mL), CH₂Cl₂ (4 x 5 mL), and dried under vacuum. The resulting peptidyl resin was cleaved, with simultaneous removal of side-
chain protecting groups using anhydrous HF/p-cresol (v/v; 19:1, 10 mL) for 1 h at 0 °C. Following evaporation of HF, the peptide was precipitated with cold Et2O and isolated by centrifugation (4000 rpm, 6 min). The precipitated product was dissolved in a 1:1 mixture of H2O and CH3CN (v/v, containing 0.1% TFA) and lyophilised to afford the crude peptide. Purification by RP-HPLC afforded peptide 6, H2N-Lys-Trp(CHO)-Trp(CHO)-Met-COSCH2CH2CO-Lys-COOH, as an amorphous solid.

Peptide 6 (142 mg, 33% yield, 99% purity); Rf 15.7 min; m/z (ESI-MS) 1078.0 ([M+2H]2+ calculated: 1078.1). Analysed by XTerra® MS C18 column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.

Scheme 2. Synthesis of the thioester fragment 6. Reagents and conditions: (i) Boc-Lys(2-Cl-Z)-PAM, DIC, CH2Cl2, r.t, 4 h; (ii) Boc-SPPS (Boc deprotection: 100% TFA, r.t, 2 min; coupling: Boc-amino acid, HATU, iPr2EtN, DMF, r.t, 5 min; (iii) S-trityl-3-mercaptopropionic acid, HATU, iPr3EtN, DMF, r.t, 30 min; (iv) TFA/iPr3SiH/H2O (95:2.5:2.5, v/v/v), r.t, 2 x 5 min; (v) Boc-Met(O)-OH, HATU, iPr3EtN, DMF, r.t, 45 min; (vi) 30 mM Me2S, 30 mM TBAI, TFA, r.t, 2 min; (vii) HF, p-cresol, 0 °C, 1 h.

Figure 11. LC-MS chromatogram of purified thioester peptide 6. Analysed by XTerra® MS C18 column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.
4.1.2 Synthesis of peptide 3

Procedure one

A solution of HMPB linker (72.1 mg, 0.3 mmol) and DIC (47 µL, 0.3 mmol) in CH$_2$Cl$_2$/DMF (v/v; 2:1, 3 mL) was added to pre-swollen (CH$_2$Cl$_2$, 3 mL, 20 min) aminomethyl polystyrene resin (110.0 mg, 0.1 mmol, loading 0.91 mmol/g) and the mixture was shaken for 4 h at room temperature, filtered, and washed with DMF (4 × 3 mL). A negative Kaiser test$^{13}$ confirmed the coupling. A mixture of Fmoc-His(Trt)-OH (185.9 mg, 0.3 mmol), DIC (47 µL, 0.3 mmol) and DMAP (1.2 mg, 0.01 mmol) in DMF (3 mL) was then added to the resin and the reaction mixture was shaken for 1 h at room temperature to yield Fmoc-His(Trt)-HMPB-resin S16. This procedure was repeated once with fresh reagents. Solid phase peptide synthesis was performed on the resulting resin at room temperature using a PS3$^{\text{TM}}$ automated Peptide Synthesizer (Protein Technologies Inc., Arizona, USA). Deprotection of the Fmoc group was accomplished using 20% piperidine in DMF (3 mL, v/v) for 2×5 min with consecutive DMF washes after each addition. Amino acid couplings were performed using a mixture of Fmoc-amino acid (0.4 mmol), HATU (136.9 mg, 0.36 mmol), iPr$_2$EtN (139.4 µL, 0.8 mmol) in DMF at room temperature for 35 min, except Fmoc-L-Ser(β-GlcNAc(OAc)$_3$)-OH S6 which was coupled using a mixture of Fmoc-amino acid (131.3 mg, 0.2 mmol), HATU (74.1 mg, 0.195 mmol), HOAt (26.5, 0.195 mmol), and 2,4,6-trimethylpyridine (25.8 µL, 0.195 mmol) in DMF at room temperature overnight to yield S17. The complete side-chain protected peptide was released from the resin by the treatment of 1% TFA in CH$_2$Cl$_2$ (4 mL, v/v) for 4 × 5 min followed by removal of the resin by filtration. Solvent from the combined filtrates was evaporated under reduced pressure and the residue was re-suspended in 3:7 mixture of H$_2$O and CH$_3$CN (v/v, containing 0.1% TFA) and lyophilised to yield the protected precursor S18, which was used without further purification.

The crude fully protected peptide S18 solution in CH$_2$Cl$_2$ (20 mL) was reacted with benzyl mercaptan (469.6 µL, 4.0 mmol), DIC (626.3 µL, 4.0 mmol), 6-Cl-HOBt (678.3 mg, 4.0 mmol) and iPr$_2$EtN (231.7 µL, 1.33 mmol) at room temperature overnight. Solvent was removed by evaporation using a flow of N$_2$ and the crude product treated with TFA/iPr$_2$SiH/H$_2$O/EDT (v/v/v/v; 94:1:2.5:2.5, 10 mL) for 2 h for deprotection of side-chain protecting groups. Following evaporation of TFA, the peptide was precipitated with cold Et$_2$O and isolated by centrifugation (4000 rpm, 6 min). The precipitated product was dissolved in 1:1 mixture of H$_2$O and CH$_3$CN (v/v, containing 0.1% TFA) and lyophilised to afford the crude peptide. Purification by RP-HPLC afforded peptide 3, H$_2$N-$^{12}$Thz-$^{18}$Ser(β-GlcNAc(OAc)$_3$)-$^{27}$His-COSBn, as an amorphous solid.
Glycopeptide 3 (50.1 mg, 23% yield based on 0.1 mmol, 98% purity); \( R_t \) 17.3 min; \( m/z \) (ESI-MS) 1089.0 ([M+2H]\(^2+\) calculated: 1088.9). Analysed by X Terra® MS C\(_{18}\) column (4.6 x 150 mm; 5 \( \mu \)m), gradient 5-75% B over 35 mins, 1.0 mL/min.

**Scheme 3.** Synthesis of glycopeptide 3. **Reagents and conditions:** (i) 4-(4-Hydroxymethyl-3-methoxyphenoxy)butyric acid (HMPB), DIC, CH\(_2\)Cl\(_2\), r.t, 4h; (ii) Fmoc-His(Trt)-OH, DIC, DMAP, DMF, r.t, 2 x 1 h; (iii) Fmoc-SPPS (Fmoc deprotection: 20% piperidine in DMF (v/v), r.t, 2 x 5 min; coupling: Fmoc-amino acid (4.0 eq.), HATU (3.6 eq.), \( iPr_2EtN \) (8 eq.), DMF, r.t, 40 min (except Fmoc-L-Ser(\( \beta \)-GlcNAc(OAc))\(_3\)) -OH S6 (2 eq.), HATU (1.95 eq.), HOAt (1.95 eq.), TMP (1.95 eq.), DMF, r.t, overnight); (iv) 1% TFA in CH\(_2\)Cl\(_2\) (v/v), r.t, 4 x 5 min; (v) benzyl mercaptan (4.0 eq.), DIC (4.0 eq.), 6-Cl-HOBT (4.0 eq.), \( iPr_2EtN \) (1.3 eq.), CH\(_2\)Cl\(_2\), r.t, overnight; (vi) TFA/EDT/H\(_2\)O/\( iPr_3SiH \) (94:2.5:2.5:1, v/v/v/v), r.t, 2 h.
Figure 12. LC-MS chromatograms for the synthesis of the thiazolidine-thioester fragment 3. (A) Crude TFA-treated peptide S18; (B) Purified glycopeptide 3. Analysed by XTerra® MS C18 column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.
**Procedure two (optimised Method)**

Fmoc-His(Trt)-OH (123.9 mg, 0.2 mmol) was dissolved in CH₂Cl₂ (2 mL) and added to 2-ClTrtCl resin (53 mg, 0.1 mmol, loading of 0.8-3.0 mmol/g). iPr₂EtN (35 µL, 0.2 mmol) was then added and the mixture was shaken at room temperature for 1 h. The resin was then filtered, washed with DMF, and unreacted resin beads were capped by treatment with CH₂Cl₂/CH₃OH/iPr₂EtN (v/v/v; 80:15:5) for 2 x 10 min. The resin was then washed with DMF (4 x 4 mL). The remaining sequence was assembled using Fmoc-SPPS, as described in ‘procedure one’ except for Fmoc-Cys(Trt)-OH (for the coupling of 21Cys) which was coupled using a mixture of Fmoc-amino acid (234.3 mg, 0.4 mmol), HCTU (148.9 mg, 0.36 mmol), HOAt (49 mg, 0.36 mmol), and 2,4,6-trimethylpyridine (106 µL, 0.8 mmol) in CH₂Cl₂/DMF (v/v; 1:1) at room temperature for 1 h. The peptidyl-resin S₁₉ was then suspended in a mixture of TFE/CH₂Cl₂ (v/v; 2:8, 5 mL), shaken at room temperature for 1 h, and filtered. The residual solvents were then removed *in vacuo* and the residue was re-suspended in 1:1 mixture of H₂O and CH₃CN (v/v, containing 0.1% TFA) and lyophilised to afford side-chain protected precursor S₁₈, which was used without further purification.

The crude fully protected peptide S₁₈ in CH₂Cl₂/DMF (v/v; 2:1, 30 mL) was reacted with benzyl mercaptan (408 µL, 3.48 mmol), DIC (539 µL, 3.48 mmol), and 6-Cl-HOBt (590.1 mg, 3.48 mmol) at 4 °C for 1 h then left at room temperature overnight. Solvent was removed by evaporation using a flow of N₂ and the crude product was precipitated with H₂O, isolated by centrifugation (4000 rpm, 6 min), and lyophilised. The crude side-chain protected peptide was then treated with TFA/iPr₃SiH/H₂O/EDT (v/v/v/v; 94:1:2.5:2.5, 10 mL) for 2 h for deprotection of side-chain protecting groups followed by precipitation of the crude peptide using cold Et₂O and isolation by centrifugation (4000 rpm, 6 min). The precipitated product was then dissolved in 1:1 mixture of H₂O and CH₃CN (v/v, containing 0.1% TFA) and lyophilised to afford the crude peptide 3 (89 mg, 41% crude yield). Analysed by XTerra® MS C₁₈ column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.
Scheme 4. Optimised synthesis of the thiazolidine-thioester fragment 3. Reagents and conditions: (i) Fmoc-His(Trt)-OH (2 eq.), iPr2EtN (2 eq.), CH2Cl2, r.t, 1 h then CH2Cl2/CH3OH/iPr2EtN (v/v/v; 80:15:5) for 2 x 10 min; (ii) Fmoc-SPPS (Fmoc deprotection: 20% piperidine in DMF, r.t, 2 x 5 min; coupling: Fmoc-amino acid (4.0 eq.), HATU (3.6 eq.), iPr2EtN (8.0 eq.), DMF, r.t, 40 min (except Fmoc-L-18Ser(β-GlcNAc(OAc)-OH S6 (2.0 eq.), HATU (1.95 eq.), HOAt (1.95 eq.), TMP (1.95 eq.), DMF, r.t, overnight and Fmoc-L-21Cys(Trt)-OH S11 (4.0 eq.), HCTU (3.6 eq.), HOAt (3.6 eq.), TMP (8.0 eq.), CH2Cl2/DMF (1:1, v/v), r.t, 2 x 1 h); (iii) 20% TFE/CH2Cl2 (2:8, v/v), r.t, 1 h; (iv) benzyl mercaptan (3.48 eq.), DIC (3.48 eq.), 6-Cl-HOBt (3.48 eq.), CH2Cl2/DMF (2:1, v/v), 4 °C for 1 h then r.t overnight; (v) TFA/EDT/H2O/iPr3SiH (94:2.5:2.5:1, v/v/v/v), r.t, 2 h.

Figure 13. Analytical RP-HPLC chromatograms for the synthesis of peptide 3. A) prior to activation, B) after activation. Analysed by XTerra® MS C18 column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.
4.1.3 Synthesis of peptide 2

Fmoc-L-Cys(β-GlcNAc(OAc))_2-OH S11 (134.5 mg, 0.2 mmol) was dissolved in CH₂Cl₂ (2 mL) and added to 2-CITrCl resin (53 mg, 0.1 mmol, loading of 0.8-3.0 mmol/g) followed by addition of iPr₂EtN (35 µL, 0.2 mmol) which was then shaken at room temperature for 1 h. The resin was then filtered, washed with DMF, and unreacted resin beads were capped by treatment with CH₂Cl₂/CH₃OH/iPr₂EtN (v/v/v; 80:15:5) for 2 x 10 min. The remaining sequence was assembled using Fmoc-SPPS, as described in the synthesis of peptide 3. The resin-bound peptide S20 was then treated with TFA/iPr₃SiH/H₂O/DODT (v/v/v/v; 94:2.5:2.5, 10 mL) for 2 h. After work-up and RP-HPLC purification (as previously described), glycopeptide 2, H₂N–28Cys–43Cys(β-GlcNAc(OAc))₃–COOH, was afforded as an amorphous solid.

Glycopeptide 2 (60 mg, 29% yield, 98% purity); Rₜ 11.9 min; m/z (ESI-MS) 1033.8 ([M+2H]²⁺ calculated: 1033.9). Analysed by XTerra® MS C₁₈ column (4.6 x 150 mm; 5 µm), gradient 5-65% B over 30 mins, 1.0 mL/min.

Scheme 5. Synthesis of the cysteinyli peptide 2. Reagents and conditions: (i) Fmoc-L-Cys(β-GlcNAc(OAc))₂-OH S11 (2.0 eq.), iPr₂EtN (2.0 eq.), CH₂Cl₂, r.t, 1 h; (ii) Fmoc-SPPS (Fmoc deprotection: 20% piperidine in DMF (v/v), r.t, 2 x 5 min; coupling: Fmoc-amino acid (4.0 eq.), HATU (3.6 eq.), iPr₂EtN (8.0 eq.), DMF, r.t, 40 min; (iii) TFA/DODT/H₂O/iPr₃SiH (94:2.5:2.5:1, v/v/v/v), r.t, 2 h.

Figure 14. LC-MS chromatogram of purified peptide 2. Analysed by XTerra® MS C₁₈ column (4.6 x 150 mm; 5 µm), gradient 5-65% B over 30 mins, 1.0 mL/min.
4.1.4 Synthesis of polypeptides 5a and 5b

To a degassed solution of 6 M Gn·HCl containing 200 mM Na₂HPO₄ (18.4 mL) was added 100 mM MPAA and 20 mM TCEP. The pH of the resulting solution was adjusted to 6.8 by the addition of 10 M NaOH. To this solution was added peptide 3 (40 mg, 18.4 μmol, final peptide conc. 1 mM) and peptide 2 (38 mg, 18.4 μmol, final peptide conc. 1 mM). The reaction mixture was left at room temperature under argon. Upon completion of the ligation which yielded 4, as judged by LC-MS of the reaction mixture, the pH of the reaction mixture was adjusted to 4.0 by the addition of 5 M HCl. To effect Thz unmasking, 200 mM methoxyamine·HCl was added, and the reaction mixture left at room temperature for 16 h. Purification by RP-HPLC afforded peptide 5a, H₂N₁²Cys⁻¹⁸Ser(β-GlcNAc(OAc)₃)⁻D⁻²⁷His⁻⁴³Cys(β-GlcNAc(OAc)₃)⁻COOH and peptide 5b, H₂N₁²Cys⁻¹⁸Ser(β-GlcNAc(OAc)₃)⁻L⁻²⁷His⁻⁴³Cys(β-GlcNAc(OAc)₃)⁻COOH as amorphous solids.

Glycopeptide 5a (15 mg, 20% yield, 98% purity); Rₜ 14.7 min; m/z (ESI-MS) 1369.8 ([M+3H]³⁺ calculated: 1369.9). Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min.

Glycopeptide 5b (16.5 mg, 22% yield, 98% purity); Rₜ 15.2 min; m/z (ESI-MS) 1369.8 ([M+3H]³⁺ calculated: 1369.9). Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min.
Scheme 6. Synthesis of glycopeptides 5a and 5b. Reagents and conditions: (i) 6 M Gn.HCl, 0.2 M Na$_2$HPO$_4$, 100 mM MPAA, 20 mM TCEP, pH 6.8, r.t, 2 h; (ii) methoxyamine-HCl, pH 4, r.t, 16 h.

Figure 15. LC-MS chromatograms for synthesis of glycopeptide 5. (A) NCL of glycopeptides 3 and 2 at t=0 min; (B) Generation of glycopeptide 4 at t = 2 h. (C) Thz to Cys conversion reaction to make glycopeptide 5 after 16 h. Analysed by X Terra® MS C$_{18}$ column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.
Figure 16. LC-MS chromatograms of purified peptides 5a and 5b. Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min.

4.1.5 Synthesis of polypeptides 7a and 7b

To a degassed solution of 6 M Gn-HCl containing 200 mM Na₂HPO₄ (4.87 mL) was added 100 mM MPAA and 20 mM TCEP. The pH of the resulting solution was adjusted to 6.8 by the addition of 10 M NaOH. To this solution was added peptide 5a or 5b (13 mg, 3.17 μmol, final peptide conc. 1 mM) and peptide 6 (5.8 mg, 3.17 μmol, final peptide conc. 1 mM). The reaction mixture was left at room temperature under argon. Upon completion of the ligation, as judged by LC-MS of the reaction mixture, the pH of the reaction mixture was adjusted to 4.0 by the addition of 5 M aq. HCl. The product recovered by solid phase extraction and lyophilised to afford peptide 7a, H₂N-¹Lys-⁶Trp(CHO)-⁶Trp(CHO)-¹⁸Ser(β-GlcNAc(OAc)₃)-D-²⁷His-⁴³Cys(β-GlcNAc(OAc)₃)-COOH, and peptide 7b, H₂N-¹Lys-⁴Trp(CHO)-⁶Trp(CHO)-¹⁸Ser(β-GlcNAc(OAc)₃)-L-²⁷His-⁴³Cys(β-GlcNAc(OAc)₃)-COOH as amorphous solids, which were used in the next step without further purification.
Glycopeptide 7a (10.8 mg, 62% crude yield); R<sub>t</sub> 17.8 min; m/z (ESI-MS) 1379.7 ([M+4H]<sup>4+</sup> calculated: 1379.7). Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min.

Glycopeptide 7b (11.4 mg, 65% crude yield), R<sub>t</sub> 18.4 min; m/z (ESI-MS) 1379.7 ([M+4H]<sup>4+</sup> calculated: 1379.7). Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min.

Scheme 7. Synthesis of glycopeptides 7a and 7b. Reagents and conditions: (i) 6 M Gn.HCl, 0.2 M Na<sub>2</sub>HPO<sub>4</sub>, 100 mM MPAA, 20 mM TCEP, pH 6.8, r.t, 4 h.

Figure 17. LC-MS chromatograms for synthesis of glycopeptide 7a. (A) NCL of glycopeptides 6 and 5a at t=0 min; (B) Generation of the desired glycopeptide at t = 4 h. Analysed by XTerra<sup>®</sup> MS C<sub>18</sub> column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.

### 4.1.6 Synthesis of polypeptides 8a and 8b

To a mixture of NMP, 6 M Gn·HCl and 1.0 M HEPES (v/v/v; 22.5:5.6:9.4, 0.68 mL) was added the crude polypeptide 7a or 7b (10 mg, 1.81 µmol). To this solution, a pre-cooled solution of hydrazine with 2-mercaptoethanol (v/v; 25:37.5, 1.13 mL) was added and the reaction mixture was left at 0 °C (final peptide conc. 1 mM). Upon completion of the reaction, as judged by LC-MS of the reaction mixture, the product was recovered by solid phase extraction and lyophilised. The reaction afforded epimeric polypeptide 8a, H$_2$N-$^1$Lys-$^{18}$Ser($\beta$-GlcNAc)-$^{27}$His-$^{43}$Cys($\beta$-GlcNAc)-COOH and polypeptide 8b, H$_2$N-$^1$Lys-$^{18}$Ser($\beta$-GlcNAc)-$^{27}$His-$^{43}$Cys($\beta$-GlcNAc)-COOH as amorphous solids, where were used in the next step without any further purification.

Glycopeptide 8a (4.9 mg, 52% crude yield); $R_t$ 17.2 min; $m/z$ (ESI-MS) 1301.2 ([M+4H]$^{4+}$ calculated: 1302.6). Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min.

Glycopeptide 8b (5.4 mg, 57% crude yield); $R_t$ 17.5 min; $m/z$ (ESI-MS) 1301.6 ([M+4H]$^{4+}$ calculated: 1302.6). Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min.

**Scheme 8.** Global deprotection of acetyl and formyl groups to yield the glycopeptides 8a and 8b. Reagents and conditions: 6 M Gn·HCl, 1 M HEPES, hydrazine, 2-mercaptoethanol, 0 ºC, 30 min.
Figure 20. LC-MS chromatograms for synthesis of glycopeptide 8a. (A) The deprotection reaction at t=0; (B) Generation of the desired glycopeptide at t=30 min. Analysed by XTerra® MS C18 column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.

Figure 21. LC-MS chromatograms for the synthesis of glycopeptide 8b. (A) The deprotection reaction at t=0; (B) Generation of the desired glycopeptide at t=30 min. Analysed by XTerra® MS C18 column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.

4.1.7 Synthesis of epi-(D-27His)-GccF 1a and native GccF 1b

8 mM cysteine, 1 mM cystine and 0.1 mM EDTA were dissolved in a buffer solution containing 6 M Gn-HCl and 200 mM Na₂HPO₄ and the pH adjusted to 8.2 by the addition of 10 M NaOH. The crude polypeptide 8a or 8b (4 mg, 0.77 µmol) was dissolved to a final peptide concentration of 1 mM. Peptide was dissolved by sonication, then diluted to 0.25 mM final peptide concentration (ca. 1.5 M Gn-HCl, 50 mM Na₂HPO₄, 2 mM cysteine, 0.25 mM cystine, 0.025 mM EDTA) by the addition of Milli-Q water. The resultant mixture was stored at 4 ºC until completion of the reaction as judged by LC-MS. Purification by RP-HPLC afforded 1a, native GccF, and 1b, epi-(D-27His)-GccF as amorphous solids.

epi-(D-27His)-GccF 1a (1.1 mg, 29% yield, 99% purity); Rₜ 17.3 min; m/z (HRESI-MS) 1040.8203 ([M+5H]⁵⁺ requires for C₂₂₆H₃₃₆N₉O₇₂S⁷: 1041.4634). Analysed by XTerra® MS C₁₈ column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.

GccF 1b (1.3 mg, 32% yield, 99% purity); Rₜ 17.5 min; m/z (HRESI-MS) 1040.8203 ([M+5H]⁵⁺ requires for C₂₂₆H₃₃₆N₉O₇₂S⁷: 1041.4634). Analysed by XTerra® MS C₁₈ column (4.6 x 150 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.
Scheme 9. The final oxidative folding reaction to synthesise epi-(D-27His)-GccF 1a and native GccF 1b. Reagents and conditions: 1.5 M Gn·HCl, 50 mM Na₂HPO₄, 2 mM cysteine, 0.25 mM cysteine, 0.025 mM EDTA, pH 8.2, 0.25 mM peptide, 4 °C, 16h.

4.3  Synthesis of ‘Glyco-mutant’ of GccF 10 and 11

4.3.1  Direct synthesis of peptides 14 and 15

Fmoc-L-Ser(β-GlcNAc(OAc)3)-OH  S6 (for peptide 14) or Fmoc-L-Cys(β-GlcNAc(OAc)3)-OH  S11 (for peptide 15) were dissolved separately in CH$_2$Cl$_2$ (2 mL) and added separately to 2-ClTrtCl resin (53 mg, 0.1 mmol, loading of 0.8-3.0 mmol/g). iPr$_2$EtN (35 µL, 0.2 mmol) was then added to the separate mixtures and the reactions were shaken at room temperature for 1 h. The resins were then filtered, washed with DMF, and unreacted resin were capped by treatment with CH$_2$Cl$_2$/CH$_3$OH/iPr$_2$EtN (v/v/v; 80:15:5) for 2 x 10 min.

The remaining sequences were assembled via Fmoc-SPPS, using the same conditions described previously in the optimised synthesis of peptide 3 (Section 4.1.2, Procedure two). Fmoc-Gly-Thr(ψ$_{Me,Me}$pro)-OH, Fmoc-Tyr(tBu)-Ser(ψ$_{Me,Me}$pro)-OH, and Fmoc-Ser(tBu)-Ser(ψ$_{Me,Me}$pro)-OH were also coupled in their respective positions as per the conditions described in Section 4.1.2.

The resin-bound peptides 12 and 13 were then treated separately with TFA/iPr$_3$SiH/H$_2$O/EDT (v/v/v/v; 94:1:2.5:2.5, 10 mL) for 2 h. After work-up and RP-HPLC purification, glycopeptide 14, H$_2$N-12-Cys-$^{18}$Ser(β-GlcNAc(OAc)$_3$)-43-Ser(β-GlcNAc(OAc)$_3$)-COOH and 15, H$_2$N-12-Cys-$^{18}$Cys(β-GlcNAc(OAc)$_3$)-43-Cys(β-GlcNAc(OAc)$_3$)-COOH, were afforded as amorphous solids.

Glycopeptide 14 (70 mg, 17% yield, 98% purity); R, 15.9 min; m/z (ESI-MS) 1364.5 ([M+3H]$^{3+}$ calculated: 1364.6). (Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min).
Glycopeptide 15 (57.7 mg, 14% yield, 98% purity); \( R_t \) 15.8 min; \( m/z \) (ESI-MS) 1375.3 ([M+3H]\(^3+\) calculated: 1375.3). (Analysed using a linear gradient of 5%B to 65%B over 30 min, ca 2%B/min).

Scheme 10. Synthesis of peptide fragments 14 and 15. Reagents and conditions: (i) Fmoc-L-Cys(β-GlcNAc(OAc)\(_3\))-OH S11 or Fmoc-L-Ser(β-GlcNAc(OAc)\(_3\))-OH S6, iPr\(_2\)EtN, CH\(_2\)Cl\(_2\), r.t, 1 h; (ii) Fmoc-SPPS (Fmoc deprotection: 20% piperidine in DMF (v/v), r.t, 2 x 5 min; coupling: Fmoc-amino acid (4.0 eq.), HATU (3.6 eq.), iPr\(_2\)EtN (8.0 eq.), DMF, r.t, 40 min (except Fmoc-L-18Ser(β-GlcNAc(OAc)\(_3\))-OH S6 (2.0 eq.), HATU (1.95 eq.), HOAt (1.95 eq.), TMP (1.95 eq.), DMF, r.t, overnight and Fmoc-22Cys(Trt)-OH (4.0 eq.), HATU (3.6 eq.), HOAt (3.6 eq.), TMP (8.0 eq.), CH\(_2\)Cl\(_2\)/DMF (1:1, v/v), r.t, 2 x 1 h); (iii) TFA/EDT/H\(_2\)O/iPr\(_3\)SiH (94:2.5:2.5:1, v/v/v/v), r.t, 2 h.

Figure 30. LC-MS chromatogram of purified peptide 15. Analysed using a linear gradient of 5%B to 65%B over 30 min, ca 2%B/min.

4.3.2 Synthesis of polypeptides S21 and S22

NCL reactions of peptides 14 (19.9 mg, 4.87 μmol) and 15 (20.1 mg, 4.87 μmol) with peptide 6 (10.5 mg, 4.87 μmol) were performed as described previously in the synthesis of peptide 7 using the ligation buffer (6 M GnHCl, 0.2 M Na₂HPO₄, 20 mM TCEP, and 100 mM MPAA) at a final peptide concentration of 1 Mm (Section 4.1.5). Purification by RP-HPLC afforded S21, H₂N⁻¹Lys⁻¹⁸Ser(β-GlcNAc(OAc)₃)⁻⁴³Ser(β-GlcNAc(OAc)₃)⁻⁴⁴COOH, and S22, H₂N⁻¹Lys⁻¹⁸Cys(β-GlcNAc(OAc)₃)⁻⁴³Cys(β-GlcNAc(OAc)₃)⁻⁴⁴COOH as amorphous solids.

Glycopeptide S21 (10.7 mg, 40% yield, 97% purity); Rₜ 19.4 min; m/z (ESI-MS) 1375.3 ([M+4H]⁴⁺ calculated: 1375.3). (Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min).

Glycopeptide S22 (11.9 mg, 44% yield, 99% purity); Rₜ 19.2 min; m/z (ESI-MS) 1383.4 ([M+4H]⁴⁺ calculated: 1383.3). (Analysed using a linear gradient of 5%B to 65%B over 30 min, ca 2%B/min).
Scheme 11. Synthesis of glycopeptides S21 and S22. Reagents and conditions: (i) 6 M Gn.HCl, 0.2 M Na$_2$HPO$_4$, 100 mM MPAA, 20 mM TCEP, pH 6.8, r.t, 4 h.

Figure 31. LC-MS chromatograms for synthesis of glycopeptide S21. (A) NCL of peptides 6 and 14 at t=0 min; (B) Generation of the desired glycopeptide at t = 4 h. Analysed by Vydac TP Diphenyl column (4.6 x 250 mm; 5 µm), gradient 5-75% B over 35 mins, 1.0 mL/min.
Figure 32. LC-MS chromatogram of purified peptide fragment S21. Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min.

Figure 34. LC-MS chromatogram of purified peptide fragment S22. Analysed using a linear gradient of 5%B to 65%B over 30 min, ca 2%B/min.
4.3.3 Synthesis of polypeptides S23 and S24

Glycopeptides S21 (10.7 mg, 1.95 µmol) or S22 (11.9 mg, 2.15 µmol) were subjected to global deprotection for simultaneous cleavage of the formyl groups on the side-chain of Trp and acetyl group on sugar moiety using the same conditions described previously in the synthesis of glycopeptide 8 (Section 4.1.6). Purification by RP-HPLC afforded S23 H$_2$N-$^{1}$Lys-$^{18}$Ser(β-GlcNAc)$^{-43}$Ser(β-GlcNAc)-COOH, and S24, H$_2$N-$^{1}$Lys-$^{18}$Cys(β-GlcNAc)$^{-43}$Cys(β-GlcNAc)-COOH as amorphous solids.

Glycopeptide S23 (3.14 mg, 31% yield, 98% purity); $R_t$ 17.8 min; $m/z$ (ESI-MS) 1298.1 ([M+4H]$^4^+$ calculated: 1298.6). (Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min).

Glycopeptide S24 (5.84 mg, 52% yield, 98% purity); $R_t$ 18.2 min; $m/z$ (ESI-MS) 1306.6 ([M+4H]$^4^+$ calculated: 1306.6). (Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min).

Scheme 12. Deprotection of acetyl and formyl groups to yield the glycopeptides S23 and S24. Reagents and conditions: 6 M Gn.HCl, 1 M HEPES, hydrazine, 2-mercaptoethanol, 0 °C, 30 min.

Figure 36. LC-MS chromatogram of purified peptide fragment S23. Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min.
4.3.4 Synthesis of ‘Glyco-mutant’ 10 and 11

Glycopeptides S23 (3.14 mg, 0.60 µmol) or S24 (5.84 mg, 1.12 µmol) were folded using the same conditions described previously in the synthesis of native GccF 1 (Section 4.1.7). Purification by RP-HPLC afforded ‘glyco-mutant’ 10 and 11 as amorphous solids.
‘glyco-mutant’ 10 (0.9 mg, 29% yield, 99% purity); \( R_t \) 17.5 min; \( m/z \) (HRESI-MS) 1037.6191 ([M+5H]^5+) requires for \( C_{226}H_{316}N_{57}O_{73}S_6 \): 1038.2672). (Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min).

‘glyco-mutant’ 11 (1.8 mg, 31% yield, 99% purity); \( R_t \) 17.4 min; \( m/z \) (HRESI-MS) 1044.0154 ([M+5H]^5+) requires for \( C_{226}H_{316}N_{57}O_{73}S_8 \): 1044.6594). (Analysed using a linear gradient of 5%B to 75%B over 35 min, ca 2%B/min).

**Scheme 13.** The final oxidative folding of S23 and S24 to synthesise ‘glyco-mutant’ of GccF 10 and 11, respectively. **Reagents and conditions:** 1.5 M Gn·HCl, 50 mM Na_2HPO_4, 2 mM cysteine, 0.25 mM cystine, 0.025 mM EDTA, pH 8.2, 0.25 mM peptide, 4 °C, 16h.

5 Circular Dichroism (CD) Spectroscopy

All CD spectra were recorded using a Chirascan CD spectrometer (Applied Photophysics Ltd., UK) at 20 °C with a cuvette of 0.1 mm path length (106-QS, Hellma Analytics, Müllheim, Germany) in the range from 180 and 260 nm at 0.5 nm intervals with a time-to-point of 0.5 s. Each CD spectrum measurement was normalised to 1 mg mL$^{-1}$ concentration. The Spectra the average of ten scans obtained with a 1 nm optical bandwidth. The baseline scans were collected with the solvent alone (milliQ Water), averaged as above, and then subtracted from the sample scans. Data are expressed as mean residue ellipticities [$\Theta$] in (deg cm$^2$ dmol$^{-1}$), and were calculated using Pro-Data Viewer (version 4.1.1, Applied Photophysics Ltd., UK).

Figure 43. Circular dichroism spectroscopy data acquired at 1 mg mL$^{-1}$ peptide in MilliQ Water of (A) Natural GccF and the synthetic derivative 1b; (B) GccF analogues 1a, 10 and 11.
6 Antibacterial Assay

The glycopeptides were assayed for activity against *Lactobacillus plantarum* strain 8014, using a 96-well plate reader. Serial dilutions of the compound to be tested were prepared in MRS broth (Merck) and was added, in triplicate, to a 96-well plate containing an equal volume of *L. plantarum* 8014 at optical density 0.05. Additional positive controls (cells with no treatment) and negative controls (MRS media with no cells) were included, also in triplicate. Cells were grown in a Multiskan GO plate reader (Thermo Scientific) for 12-15 h, at 30 °C, and absorbance measured at 600 nm every 15 min. The growth of cells in each peptide concentration was modelled against the internal positive control, and the percentage inhibition derived at each time point as the difference between the optical density of the positive control and the optical density of cells within a given peptide concentration. Taking the maximum point from plots of percentage inhibition versus time for each peptide concentration allowed a polynomial fit to be applied, and the concentration required to reach 50% inhibition derived. Statistical error was taken as the maximum variance across the triplicates of each concentration in a given plate reader run.

![Figure 4](image)

**Figure 4.** The results from testing the bacterially-isolated GccF, synthetic GccF (1b) and analogues 1a, 10, and 11, plotted as percentage inhibition of *Lactobacillus plantarum* ATCC 8014 growth vs concentration of the glycopeptide.
