Figure S1. XRD pattern for a CuCrO₂ film grown on an ITO-coated glass substrate. Diamond symbols represent peaks for the ITO glass substrate and dots correspond to CuCrO₂ (ICSD collection code 026676).

Figure S2. N₂ adsorption isotherm obtained using CuCrO₂ powder scraped from the surface of electrodes used to obtain BET specific surface area.
Figure S3. UV-vis spectrum and Tauc Plot (inset) for a CuCrO$_2$ film grown directly on an ITO-coated glass substrate to show the direct bandgap. ITO-glass background was subtracted. Spectra were obtained using a Varian Cary 50 spectrophotometer in transmission mode.

Figure S4. Mott-Schottky plot for a CuCrO$_2$ electrode in Na$_2$SO$_4$ (0.1 M, pH 3) at room temperature. Frequency range 10 kHz to 0.1 Hz with 10 mV excitation voltage. The Randles circuit shown (inset) was used to fit Nyquist plots obtained at each potential in the ZView® software.
Figure S5. Simplified energy diagram showing hole and electron transfer alongside possible recombination routes (dashed arrows). The catalytic onset potential corresponds to the second reduction of NiP but is omitted here for simplicity. S: Sensitiser.

Figure S6. Linear sweep voltammograms for NiO/DPP-P (left) and CuCrO₂|DPP-P (right) electrodes with DTDP acceptor (5 mM) added to Na₂SO₄ (0.1 M), pH 4.56. Illumination with 100 mW cm⁻², AM 1.5 G, with a 420 nm cutoff filter and an active electrode area of 0.25 cm². A scan rate of 5 mV s⁻¹ was used and experiments were carried out at room temperature.
**Figure S7.** IPCE spectra for CuCrO$_2$ and CuCrO$_2$|DPP-P|NiP (left) and the same IPCE spectra with the UV-Vis of CuCrO$_2$|DPP-P overlaid (right). All values were recorded in Na$_2$SO$_4$ (0.1 M, pH 3) at room temperature with an applied potential of 0.0 V vs. RHE and light intensity maintained at 0.8 mW cm$^{-2}$.

**Figure S8.** CPPE trace of a CuCrO$_2$|DPP-P|NiP electrode held at 0.0 V vs. RHE in Na$_2$SO$_4$ electrolyte solution (0.1 M) adjusted to pH 3. Illumination with 100 mW cm$^{-2}$, AM 1.5 G with a 420 nm cutoff filter and an active electrode area of 1 cm$^2$. The cell was maintained at room temperature.
Table S1. Dye and catalyst loadings for the CuCrO$_2$|DPP-P/NiP with the specific surface area of CuCrO$_2$.
