General Considerations:
General: All chemical transformations requiring inert atmospheric conditions or vacuum distillation utilized Schlenk line techniques with a 4- or 5-port dual-bank manifold. Argon or nitrogen was used to provide such an atmosphere. LED irradiation was accomplished using the LED reactors described in our previous reports or the new reactor design outlined here.\(^1\) Unless otherwise noted, NMR spectra (\(^1\)H, \(^{11}\)B, \(^{13}\)C, \(^{19}\)F) were obtained at 298 K. \(^1\)H NMR spectra were referenced to residual, non-deuterated chloroform (δ 7.26) in CDCl$_3$, residual DMSO-$d_5$ (δ 2.50) in DMSO-$d_6$, acetone-$d_5$ (δ 2.09) in acetone-$d_6$, and residual MeCN-$d_2$ (δ 1.94) in MeCN-$d_3$. \(^{13}\)C NMR spectra were referenced to CDCls (δ 77.3), DMSO-$d_6$ (δ 39.5), the carbonyl carbon of acetone (δ 205.9), or the nitrile carbon of MeCN-$d_3$ (δ 118.3), respectively. \(^{19}\)F NMR spectra were referenced to hexafluorobenzene (δ –164.9)\(^2\) as an internal standard and are run with C–F/C–H decoupling. \(^{11}\)B NMR spectra were obtained on a spectrometer equipped with the appropriate decoupling accessories. Reactions were monitored by HPLC, GC/MS, \(^1\)H NMR, and/or TLC on silica gel plates (60 Å porosity, 250 μm thickness). TLC analysis was performed using hexanes/EtOAc as the eluent and visualized using permanganate stain, Seebach’s stain,\(^3\) ninhydrin stain, and/or UV light. Silica plugs utilized flash silica gel (60 Å porosity, 32-63 μm). Flash chromatography was accomplished using an automated system (monitoring at 254 nm and 280 nm) with silica cartridges (60 Å porosity, 20-40 μm). Solvents were purified with drying cartridges through a solvent delivery system. Melting points (°C) are reported uncorrected.

Chemicals: Deuterated NMR solvents were either used as purchased (MeCN-$d_3$, acetone-$d_6$, DMSO-$d_6$) or stored over 4Å molecular sieves and/or K$_2$CO$_3$ (CDCl$_3$). Na$_2$SO$_4$, MgSO$_4$, CH$_2$Cl$_2$, CHCl$_3$, EtOAc, pentane, hexanes, MeOH, Et$_2$O, and toluene were used as purchased. Et$_3$N was purchased from commercial suppliers and distilled from CaH$_2$ prior to use. THF was purchased and dried via a solvent delivery system. DMF (99.8%, extra dry) and DMSO (99.8%, extra dry)

---

were purchased from commercial sources and stored over 4 Å molecular sieves. The transition metal photocatalysts Ru(bpy)$_3$(PF$_6$)$_2$ and [Ir{dFCF$_3$ppy}$_2$(bpy)]PF$_6$ were prepared in-house by the procedure outlined in our previous publications.$^{1a,4}$ α-CF$_3$-β-TMS-alkohols were prepared in-house using the procedures outlined here. Information for previously synthesized radical precursors (preparation protocols, characterization, etc.) can be found in our earlier reports.$^5$ All other radical precursors were purchased from commercial suppliers. The oxoammonium salt 4-acetamido-2,2,6,6-tetramethyl-1-oxopiperidin-1-ium tetrafluoroborate (“Bobbitt’s Salt”) was prepared in the manner previously reported.$^6$

**Photochemistry:** Irradiation of reaction vessels was accomplished using blue LEDs. LEDs were configured as outlined in the *Photochemical Reactor Design* section of our previous articles$^{1b,c}$ or using two 34W blue (470 nm) LED lamps with the sample positioned ~ 6 cm from each lamp. A fan was employed to ensure reactions remained at or near rt when using LEDs.

1-(2-Bromophenyl)-2,2,2-trifluoroethanol

The following is a modification of the procedure outline by Kelly et al. To a 250 mL round bottom flask equipped with a stir bar was added 2-bromobenzaldehyde (7.40 g, 40 mmol, 1 equiv), THF (60 mL), and TMS-CF₃ (7.38 g, 52 mmol, 1.25 equiv). The flask was sealed with a rubber septum and placed under an argon atmosphere via an inlet needle. The reaction mixture was cooled to 0 °C in an ice-water bath. After stirring for approximately 10 min, TBAF (1 M in THF, 0.4 mL, 0.4 mmol, 0.01 equiv) was added dropwise via a syringe. After stirring for 10 min, the ice-bath was removed and the soln was allowed to stir for approximately 8 h at rt.

To cleave the silyl ether formed by the reaction, H₂O (4 mL, ~5.5 equiv) was added via a syringe followed by TBAF (1 M in THF, 4 mL, 4 mmol, 0.1 equiv). When the cleavage was judged to be complete, the contents of the flask were transferred to a separatory funnel. Deionized H₂O (100 mL) and Et₂O (~100 mL) were added and the layers were partitioned. The aq layer was extracted with Et₂O (3 × ~50 mL). The organic layers were combined, then washed once with deionized H₂O (100 mL) and brine (100 mL). The organic layer was dried (Na₂SO₄),

9 Note that on small scales (< 20 mmol), the TBAF could be added relatively fast. However, upon scale-up the addition of TBAF is quite exothermic. Hence, it is recommended that the TBAF be added as slow as possible and/or cooling the reaction mixture to a temperature lower than that of 0 °C.
10 It is recommended that this cleavage step be monitored by some form of spectroscopy (e.g., GC/MS or NMR).

1-(2-Bromophenyl)-2,2,2-trifluoroethanone$^{11}$

The following is a modification of the procedure outline by Kelly et al.$^{12}$ To a one-neck 300 mL round bottom flask equipped with a stir bar was added 1-(2-bromophenyl)-2,2,2-trifluoroethanol (8.16 g, 32 mmol, 1 equiv), 4-acetamido-2,2,6,6-tetramethyl-1-oxopiperidin-1-ium tetrafluoroborate (24.01 g, 80 mmol, 2.6 equiv), and CH$_2$Cl$_2$ (80 mL). The mixture was allowed to stir at rt for approximately 5 min. At this time, 2,6-lutidine (7.72 g, 8.34 mL, 72 mmol, 2.25 equiv) was added all at once, and the flask was sealed with a rubber septum. The reaction mixture was stirred overnight at rt and gradually turned red. The solvent was removed \textit{in vacuo} to afford a thick red residue. To this thick residue was added Et$_2$O (~100 mL), causing immediate precipitation of the spent oxidant. The heterogeneous soln was allowed to stir for 10 min, and the solids were filtered off through a medium porosity fritted funnel, washing with Et$_2$O (~100 mL). The solvent was removed from the filtrate \textit{in vacuo} by rotary evaporation. The crude material was then loaded atop a silica gel plug. The plug was eluted with Et$_2$O (~150 mL) to remove any of the residual spent oxidant. The solvent was removed from the filtrate \textit{in vacuo} by rotary evaporation to give the crude trifluoromethyl ketone. Further purification was accomplished by vacuum distillation (bp 65- 67 °C @ 0.1 mmHg), giving the pure CF$_3$ ketone (7.04 g, 87%) as a clear, yellow oil.

Alkylation

2-(2-Bromophenyl)-1,1,1-trifluoro-3-(trimethylsilyl)propan-2-ol (1a)

This procedure is a modification of the procedure outlined by Kelly et al.\textsuperscript{13} To a 100 mL flame-dried round bottom flask equipped with a stir bar was added 1-(2-bromophenyl)-2,2,2-trifluoroethanone (4.43 g, 0.0175 mol, 1 equiv) in anhyd Et$_2$O (22 mL). The flask was cooled to 0 °C via an ice-water bath for 5 min. After this time, Me$_3$SiCH$_2$MgCl (1.3 M in THF, 20.2 mL, 0.0263 mol) was added dropwise over 10 min via a syringe. The soln became bright yellow initially, then faded upon addition of additional organomagnesium reagent. After complete addition, the soln was stirred at 0 °C for 10 min, then warmed to rt. The reaction was allowed to stir at this temperature overnight.

After this time, the reaction mixture was cooled to 0 °C via an ice-water bath for 5 min. The reaction mixture was then carefully quenched dropwise with 2 M aq HCl (20 mL) \textbf{CAUTION: Exothermic.} After complete addition, the quenched reaction mixture was warmed to rt and transferred to a separatory funnel. Et$_2$O (100 mL) and deionized H$_2$O (100 mL) were added, and the layers were separated. The aq layer was extracted with Et$_2$O (3 $\times$ 50 mL). The combined organic layers were washed with 2 M aq HCl (100 mL), deionized H$_2$O (150 mL), and finally brine (150 mL). The organic layer was dried (Na$_2$SO$_4$), and the solvent was removed \textit{in vacuo} by rotary evaporation. Further purification was accomplished by vacuum distillation (bp 68-70 °C @ 0.1 mmHg), affording 2-(2-bromophenyl)-1,1,1-trifluoro-3-(trimethylsilyl)propan-2-ol 1a (4.46 g, 83%) as a colorless oil.

Trifluoromethylation

4-(4-Bromophenyl)-1,1,1-trifluorobutan-2-one

Synthesis of 4-(4-bromophenyl)-1,1,1-trifluorobutan-2-one (2.321 g, 60%) was accomplished using the procedure for the preparation of 1-(3-bromophenyl)-2,2,2-trifluoroethanone, with the following modification: The reaction was conducted using 3-(4-bromophenyl)-N-methoxy-N-methylpropanamide (3.75 g, 0.0138 mol, 1 equiv) and the quantities of other reagents were adjusted accordingly. The crude CF₃ ketone was further purified by vacuum distillation (bp 79-81 °C @ 0.1 mmHg), affording the pure CF₃ ketone as a clear, colorless oil.

Cross-Coupling vs. Radical Addition Competition Reactions

A 4 mL vial was charged with [Ni(dtbbpy)(H$_2$O)$_4$]Cl$_2$ (2.4 mg, 0.0050 mmol, 5.0 mol %), [Ru(bpy)$_3$](PF$_6$)$_2$ (2.1 mg, 0.0025 mmol, 2.5 mol %), and silicate (0.12 mmol, 1.2 equiv). The vial was evacuated and backfilled with argon three times. A degassed soln of 4-bromo-1-methoxy-2-(3,3,3-trifluoroprop-1-en-2-yl)benzene A (28.1 mg, 0.10 mmol, 1.0 equiv) in DMF (1.0 mL, 0.10 M) was then added, and the vial was sealed and irradiated with blue light for 23 h. Upon completion, the reaction was diluted with Et$_2$O (5 mL) and washed with 1 M aq NaOH (2 × 3 mL) and brine (3 mL), dried (Na$_2$SO$_4$), filtered, and concentrated. The crude material was then dissolved in CDCl$_3$, and the product distribution was examined by $^{19}$F NMR.

1,1,1-Trifluoro-2-(4-(phenylamino)phenyl)-3-(trimethylsilyl)propan-2-ol (2h) A 20 mL microwave vial was charged with Cs$_2$CO$_3$ (1.34 g, 4.20 mmol, 1.40 equiv), and flame dried under vacuum, and cooled to rt under a positive pressure of argon. The vial was then charged with XPhos Pd-G2 (47 mg, 0.060 mmol, 2.0 mol %) and evacuated and backfilled with argon three times. Anhyd toluene (6.0 mL, 0.5 M relative to aryl bromide) was then added followed by aryl bromide 1c (1.02 g, 3.00 mmol, 1.00 equiv). The vial was then sealed and heated at 100 °C in an oil bath for 24 h. Upon completion, the vial was cooled to rt, diluted with EtOAc, eluted through a plug of Celite®, and concentrated. The crude material was then purified by column chromatography (gradient hexanes to EtOAc 1% v/v Et$_3$N) to afford title compound 2h (1.05 g, 1.88 mmol, 94% yield) as a yellow oil.

The vial was sealed and heated at 80 ºC until the reaction turned orange and starting material was consumed (as monitored by HPLC). The reaction was then cooled to rt, filtered through a pad of Celite® with EtOAc (~100 mL), and concentrated. The crude mixture was then dissolved in EtOAc (20 mL) and transferred to a separatory funnel. The organic layer was washed with H$_2$O (1 x 20 mL) and brine (1 x 20 mL).

**Synthesis of Trifluoroborate**

The combined aq layers were then extracted with EtOAc (3 x 10 mL).
lyophilized overnight to remove any trace water. Acetone (~50 mL) was then added to the dry solid, the resulting slurry was then filtered to remove inorganic salts, and the acetone soln was concentrated to obtain a sticky yellow oil. The oil was dissolved in a minimal amount of CH$_2$Cl$_2$ (~5 mL) and precipitated by addition of pentane (~50 mL). A sticky brown semisolid was then collected and placed under hi-vac at 50 ºC for 8 h to obtain title compound 2k (626 mg, 1.70 mmol, 85% yield, average of three reactions) as a fine yellow powder (decomp. >150 ºC).

2-(4-(2-(Cyclohex-3-en-1-yl)ethyl)phenyl)-1,1,1-trifluoro-3-(trimethylsilyl)propan-2-ol (2p). A stir bar-equipped 8 mL vial was charged with [Ni(dtbbpy)(H$_2$O)$_4$]Cl$_2$ (23.5 mg, 0.050 mmol, 10.0 mol %), [Ru(bpy)$_3$](PF$_6$)$_2$ (21 mg, 0.025 mmol, 5.0 mol %), and ethyl cyclohexyl silicate (273 mg, 0.600 mmol, 1.20 equiv). The vial was sealed and via an inlet needle evacuated and backfilled with argon three times. Anhyd DMF (5.0 mL, 0.1 M) was then added, followed by $\alpha$-CF$_3$-$\beta$-TMS-alcohol 1c (171 mg, 0.500 mmol, 1.00 equiv). The vial was sealed with Parafilm® and irradiated with two blue Kessil lamps while rapidly stirring. The Kessil lamps were positioned ~4 inches away on opposite sides of the reaction vial. The temperature of the reaction was maintained at ~30 ºC using a fan. After 48 h, the reaction was transferred to a separatory funnel and diluted with Et$_2$O (~20 mL). The organic layer was then washed with saturated aq Na$_2$CO$_3$ (2 x 10 mL) and brine (1 x 10 mL). The combined aq layers were then back extracted with Et$_2$O (3 x 20 mL). The combined organic layers were concentrated, and the crude material was then purified by column chromatography (gradient hexanes to EtOAc 1% v/v Et$_3$N) to afford title compound 2p (132.4 mg, 0.36 mmol, 71% yield) as a colorless oil.

General Procedure for the Elimination of $\alpha$-CF$_3$-$\beta$-TMS-alcohols to CF$_3$-Alkenes

![Chemical structure](image.png)

**5-(4-(3,3,3-Trifluoroprop-1-en-2-yl)phenyl)isoquinoline (3a)**

**General Procedure**

A flame-dried 50 mL round-bottom flask equipped with a stir bar was charged with alcohol 2a (707 mg, 1.82 mmol, 1.00 equiv) and DCE (9.1 mL, 0.2 M). The resulting heterogeneous soln was chilled to 0 °C in an ice bath. Once equilibrated, TMSOTf (0.43 mL, 2.37 mmol, 1.3 equiv) was added dropwise (~1 drop/second). The ice bath was then removed, and the reaction was stirred at rt for 1 h. The flask was then equipped with a reflux condenser and refluxed at 90 °C for 3 h. Once judged done by $^1$H and $^{19}$F NMR, the reaction was cooled to rt and quenched with 10 mL of saturated aq NH$_4$Cl. After stirring for 10 min at rt, the reaction mixture was transferred to a separatory funnel and diluted with EtOAc (50 mL). The layers were then separated, and the organic layer was washed with saturated aq NaHCO$_3$ (2 x 25 mL) and brine (1 x 25 mL) and concentrated. The crude material was purified by column chromatography (gradient hexanes to EtOAc 1% v/v Et$_3$N) to afford title compound 3a (462.5 mg, 1.55 mmol, 85% yield) as a viscous colorless oil.

**Modification: 1 equiv HCl, 60 mol % TMSOTf**

An 8 mL microwave vial equipped with a stir bar was charged with alcohol 2a (195 mg, 0.500 mmol, 1.00 equiv) and DCE (5 mL, 0.1 M). The resulting heterogeneous soln was chilled to 0 °C in an ice bath. Once equilibrated, 4 N HCl in dioxane (0.13 mL, 0.500 mmol, 1.00 equiv) was added followed by dropwise addition of TMSOTf (33 μL, 0.15 mmol, 30 mol %). The ice bath was then removed, and the reaction was heated at 90 °C for 3 h, after which TMSOTf (33 μL, 0.15 mmol, 30 mol %) was again added. The reaction was then stirred overnight at 90 °C (17 h). Once judged done by $^1$H and $^{19}$F NMR, the reaction was cooled to 0 °C and quenched with 5 mL of saturated aq NaHCO$_3$. After stirring for 10 min at rt, the reaction mixture was transferred to a
separatory funnel and diluted with EtOAc (20 mL). The layers were then separated, and the organic layer was washed with saturated aq NaHCO₃ (2 x 15 mL) and brine (1 x 15 mL) and concentrated. The crude material was purified by column chromatography (gradient hexanes to EtOAc 1% v/v Et₃N) to afford title compound 3a (123.9 mg, 1.55 mmol, 83% yield) as a viscous, colorless oil.

Potassium 4-(3,3,3-Trifluoroprop-1-en-2-yl)phenyltrifluoroborate, 3k. An 8 mL microwave vial was charged with α-CF₃-β-TMS-alcohol 2k (368 mg, 1.00 mmol, 1.00 equiv) and DCE (5.0 mL, 0.2 M). The resulting soln was chilled to 0 °C in an ice bath. Once equilibrated, TMSOTf (0.36 mL, 2.0 mmol, 2.0 equiv) was added dropwise (~1 drop/second). The ice bath was then removed, and the reaction was stirred at rt for 24 h. The crude reaction was then diluted with EtOAc (25 mL) and transferred to a separatory funnel. The organic layer was then washed with H₂O (2 x 5 mL) and brine (1 x 5 mL) and then concentrated. The crude material was then dissolved in MeOH (10 mL, 0.1 M) and chilled to 0 °C in an ice bath. Once equilibrated, aq 4.5 M KHF₂ (1.40 mL, 6.75 mmol, 6.75 equiv) was then added dropwise. The reaction mixture was then stirred at rt for 1 h, after which the reaction mixture was concentrated and lyophilized overnight to remove trace water. Acetone (25 mL) was then added to the solid and the mixture was filtered to remove inorganic salts. Concentration of the filtered soln afforded the title compound 3k (272 mg, 0.978 mmol, 98% yield) as a waxy tan solid (decomp. > 130 °C).

**tert-Butyl 4-(4-(3,3,3-Trifluoroprop-1-en-2-yl)phenyl)piperidine-1-carboxylate, 3o** (101 mg, 0.285 mmol, 57% yield) was prepared according to the following procedure: α-CF₃-β-TMS-alcohol 2o (223 mg, 0.50 mmol, 1.00 equiv) was dissolved in DCE (2.5 mL, 0.2 M) and chilled to 0 ºC in an ice bath. Once equilibrated, TMSOTf (0.11 mL, 0.60 mmol, 1.2 equiv) was added dropwise, and the ice bath was removed. After stirring for 1 h at rt, TMSOTf (90 µL, 0.50 mmol, 1 equiv) was added, and the reaction was stirred at rt for 1 h. The reaction was quenched with saturated aq NaHCO₃ (5 mL) and diluted with EtOAc (5 mL). The aqueous layer was washed with EtOAc (3 x 5 mL). The combined organic layers were dried (Na₂SO₄), filtered, and concentrated. The resulting oil was transferred to a 1 dram vial, dissolved in THF (1 mL, 0.5 M), and chilled to 0 ºC. Once equilibrated, DMAP (61 mg, 0.50 mmol, 1.0 equiv) and Et₃N (0.14 mL, 1.0 mmol, 2.0 equiv) were added followed by dropwise addition of di-tert-butyl dicarbonate (164 mg, 0.750 mmol, 1.50 equiv) in THF (0.38 mL, 2.0 M). The reaction was allowed to warm to rt. After stirring overnight, the reaction was diluted with brine (5 mL) and EtOAc (5 mL). General Procedure for the Cross-Coupling with Trifluoroborate 6

7-(3,3,3-Trifluoroprop-1-en-2-yl)pyrido[2,3-b]pyrazine (4a)

To a 50 mL microwave tube was added 7-bromopyrido[2,3-b]pyrazine (210 mg, 1.0 mmol, 1 equiv), Cs$_2$CO$_3$ (978 mg, 3.0 mmol, 3 equiv), potassium trifluoro(3,3,3-trifluoroprop-1-en-2-yl)borate 6 (303 mg, 1.5 mmol, 1.5 equiv), Pd(OAc)$_2$ (11 mg, 0.05 mmol, 0.05 equiv), and PPh$_3$ (32 mg, 0.12 mmol, 0.12 equiv). The tube was sealed with a crimp-top cap containing a TFE-lined silicone septum and placed under an argon atmosphere via an inlet needle. The tube was evacuated three times via an inlet needle then purged with argon. A mixture of degassed THF (6 mL) and degassed deionized H$_2$O (3 mL) were added via syringe. The reaction mixture was allowed to stir at 80 °C for 24 h. Reaction progress was monitored by GC/MS. Once complete the reaction was cooled to rt and diluted in EtOAc (25 mL). The reaction mixture was transferred to a separatory funnel and further diluted with deionized H$_2$O (25 mL). The layers were separated, and the aq layer was extracted with EtOAc (2 × 25 mL). The combined organic layers were washed with 1 M aq NaOH (25 mL), deionized H$_2$O (25 mL), and brine (25 mL). The combined organic layers were dried (Na$_2$SO$_4$) and the solvent was removed in vacuo by rotary evaporation. Further purification was achieved by SiO$_2$ column chromatography (gradient hexanes to 80:20 hexanes/EtOAc) to give the desired olefin 4a (0.197 g, 88%) as an orange powder (mp = 113 – 115 °C).

The vial was evacuated and backfilled with argon three times. A degassed soln of trifluoromethyalkene 5c (66 mg, 0.19 mmol, 1.00 equiv) in DMSO (3.8 mL, 0.050 M relative to alkene 5c) was then added via syringe. The vial was sealed and irradiated with blue light (34W, 470 nm) at rt for 24 h. Upon completion, the reaction was diluted with EtOAc (10 mL) and the organic layer was washed with saturated aq NaHCO\(_3\) (2 x 5 mL) and brine (1 x 5 mL). The combined aq layers were then back extracted with EtOAc (2 x 5 mL). The combined organic layers were dried (Na\(_2\)SO\(_4\)), filtered, and concentrated. The crude material was then purified by column chromatography (gradient hexanes to 80:20 hexanes/EtOAc). The title compound coeluted with 4CzIPN. The mixed material was triturated with Et\(_2\)O and filtered to remove the insoluble 4CzIPN. The title compound 5d (44.9 mg, 95.5 ratio of product to starting material alkene, 0.086 mmol, 45% yield) as a colorless oil. Rotamers observed by NMR, reported major resonances.

Optimization of Suzuki Cross-Coupling with High Throughput Experimentation

High Throughput Experimentation was performed at the Penn/Merck Center for High Throughput Experimentation at the University of Pennsylvania. All solvents used in the screening center were dry and degassed. The screens were analyzed by UPLC with addition of an internal standard. The areas for the internal standard (IS), aryl bromide (ArBr), and product (P) from each of the screens are shown in the tables below. The ratios calculated are pertinent only to that specific screen; the ratios from one screen should not be quantitatively compared to those from a different screen. The results of the screens are illustrated in a heat map. The information conveyed in these heat maps is two-fold. First, the size of the circle corresponds to the amount of product. The larger the circle, the more product formed during the reaction. Secondly, the shade of the circle corresponds to the amount of starting material, in this case aryl bromide, remaining. The lighter the circle, the less aryl bromide remaining after 24 h. Therefore, for a reaction resulting in high conversion and product formation, the circle will be both large and light.

Synthesis and Utilization of Potassium trifluoro(3,3,3-trifluoroprop-1-en-2-yl)borate

\]

**Stage One**

Mg powder was activated via successive washes with 2 M aq HCl (3 x ~10 mL) followed by a wash with Et$_2$O (~20 mL). To a 250 mL Schlenk flask equipped with a stir bar was added activated Mg powder (0.85 g, 35.0 mmol). The flask was sealed with a septum and flame-dried under vacuum with an acetylene torch. The flask was purged with argon and allowed to cool to rt. To the flask was added THF (60 mL). The soln was cooled to 0 °C with an ice bath. To the cooled soln was added B(OMe)$_3$ (9.75 mL, 77.5 mmol) via syringe, and the soln was stirred vigorously. The flask stopcock was closed, and a soln of 2-bromo-3,3,3-trifluoro-1-propene (3.1 mL, 29.2 mmol) in THF (7.5 mL) was added slowly in 3 portions over 30 min. After the addition was complete, the heterogeneous soln turned dark grey. The soln was stirred at 0 °C for 6 h and then was allowed to warm to rt and stirred overnight.

**Stage Two**

The soln was cooled to 0 °C and was quenched with 6 M aq HCl (~20 mL) via a slow addition through a syringe. The mixture was allowed to stir at 0 °C for 1 h. The soln was transferred to a 500 mL separatory funnel and diluted with deionized H$_2$O (~100 mL) and Et$_2$O (~60 mL). The layers were separated, and the aq layer was extracted with Et$_2$O (2 x ~60 mL). The combined organic layers were transferred to a 500 mL round bottom flask and were cooled to 0 °C. To the flask was slowly added 4.5 M aq KHF$_2$ (40 mL). The soln was allowed to warm to rt and stirred overnight. The solvent was removed in vacuo to afford a crude solid. The solids were washed with hot acetone (4 x ~60 mL), and the filtrate was collected in a round bottom flask. The solvent was removed in vacuo to give an oily brown solid, which was dried on a vacuum line for
5 min. The solid was triturated with cold Et₂O (~80 mL) and filtered to yield a white crystalline solid (1.26 g for the first crop, 0.557 g for the second crop, 31% over 3 steps).

Rotation frames were integrated using SAINT [2], producing a listing of unaveraged \(F^2\) and \(\sigma(F^2)\) values. A total of 40795 reflections were measured over the ranges \(3.282 < 2\theta < 55.092^\circ\), \(-14 \leq h \leq 14\), \(-16 \leq k \leq 16\), \(-18 \leq l \leq 18\) yielding 7808 unique reflections (\(R_{\text{int}} = 0.0197\)). The intensity data were corrected for Lorentz and polarization effects and for absorption using SADABS [3] (minimum and maximum transmission 0.6720, 0.7456). The structure was solved by direct methods - SHELXT [4]. The asymmetric unit consists of five formula units of the title compound. Refinement was by full-matrix least squares based on \(F^2\) using SHELXL-2014 [5].
All reflections were used during refinement. The weighting scheme used was \( w = \frac{1}{\sigma^2(F_{o}^2) + (0.0264P)^2 + 1.5672P} \) where \( P = (F_{o}^2 + 2F_{c}^2)/3 \). Non-hydrogen atoms were refined anisotropically and hydrogen atoms were refined using a riding model. Refinement converged to \( R_1 = 0.0283 \) and \( wR_2 = 0.0680 \) for 7096 observed reflections for which \( F > 4\sigma(F) \) and \( R_1 = 0.0320 \) and \( wR_2 = 0.0704 \) and \( \text{GOF} = 1.081 \) for all 7808 unique, non-zero reflections and 524 variables. The maximum \( \Delta/\sigma \) in the final cycle of least squares was 0.001 and the two most prominent peaks in the final difference Fourier were +0.85 and -0.55 e/Å³.
