

A Supplementary Material: Sensitivity of Weibull parameters to σ_g

In the main text, we assumed a constant value $\sigma_g = 69$ mN/m for simplicity; this choice affects the value of $\delta = \Delta\sigma/E$ and therefore the last column (parts d, h) of Fig. 4. Figure 6 provides alternative versions of those two plots, calculated for different values (65 to 70 mN/m) of σ_g .

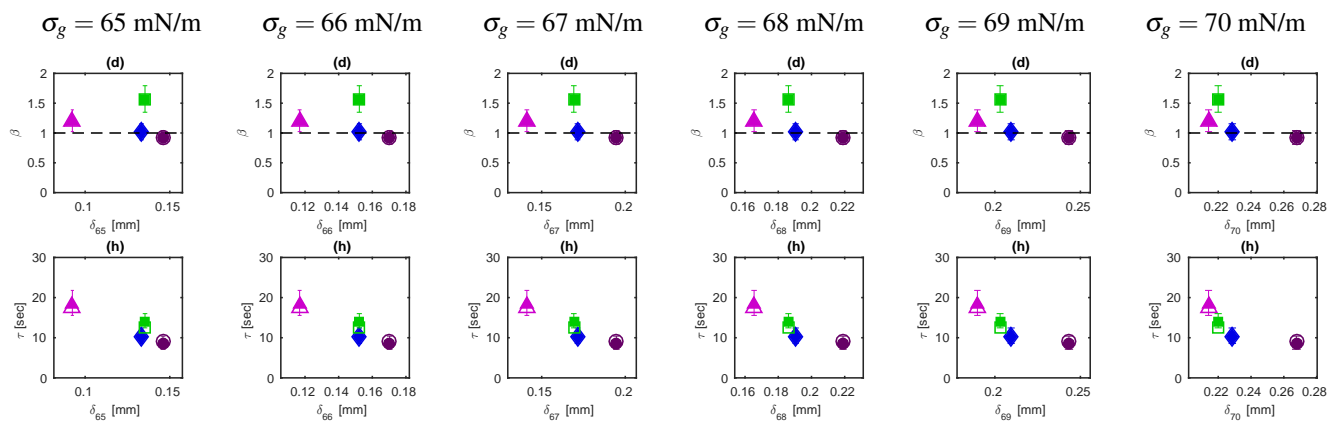

Fig. 6 Weibull parameters (β , τ) as a function of the elastocapillary number δ for $n = 1$ from the four data series (solid symbols) with mean delay time $\langle T \rangle$ (open symbols). Error bars are 95% confidence intervals on the fit parameters.
