1 EXPERIMENTAL SECTION

1.1 Synthesis of Double-11-alkyl carboxylic acid sodium selenide

Sodium borohydride (purity ≥ 96%, 1.7047 g) in 15 mL of deionized water was added with magnetic stirring into Se (purity ≥ 99%, 1.4836 g) suspension in deionized water (25 mL) under N₂ flow. The Se powder was disappeared with the generation of H₂ and a colorless Na₂Se solution was obtained within 10 min. The mixture was continuous stirred for 20 min at 50 °C. Then 11-Bromoundecanonic (purity 97.5%, 10 g) dissolved in DMSO (purity ≥ 99%, 75 mL) was injected into it and the mixture was stirred for 18 h at 50 °C. The yellow mixture was extracted three times with dichloromethane (purity ≥ 99%). The dichloromethane layer was washed three times by water, dried with anhydrous Na₂SO₄ (purity ≥ 99%), and evaporated. The residue double-11-alkyl carboxylic acid selenide dissolved in ethanol was added with magnetic stirring to
saturated NaOH ethanol/water (9:1) solution. After this the solution was filtered. The yellow crystal, Double-11-alkyl carboxylic acid sodium selenide was obtained by recrystallization with ethanol-water (4:1) (5.86 g, purity ≥ 99% , yield 63 %). 1H NMR (400 MHz, D2O) δ 2.57 - 2.45 (m, 4H), 2.07 (dd, J = 9.2, 5.8 Hz, 4H), 1.67 - 1.50 (m, 4H), 1.44 (t, J = 6.8 Hz, 4H), 1.25 - 1.19 (s, 28H).

1.2 Measurement of the critical micellar concentration (cmc)

The cmc of C₁₁-Se-C₁₁ before and after oxidation was measured using a Varian Cary Eclipse spectrometer (Varian Inc. USA). The fluorescence emission spectra were recorded from 550 to 750 nm. The excitation wavelength was set at 540 nm, and the excitation and emission slit widths were 5 nm, and the scan speed was set at 250 nm·min⁻¹. First, the Nile red (NR) methanol solution (10 mL, 0.1 mM ) was prepared, and then transfer the NR methanol solution (20 uL) into series 25 mL glass bottle. Next, a series of C₁₁-Se-C₁₁ solutions were transfered into glass bottle after remove of methanol by blow N₂, and then ultrasonic dispersion 2 h and oscillation 24 h. All the measurements were performed at 45 ºC.

1.3 Determination of the Krafft point (Tₖ)

The Tₖ of the D₁₁-Se-COONa solutions before and after oxidation was measured using a UV-vis spectrophotometer (Beijing purkinje general instrument co., Ltd, China). The wavelength was set at 500 nm.

1.4 Dynamic light scattering (DLS) measurements

DLS measurements were measured by using a Laser Light Scattering System (ALV/DLS/SLS-5022F, HOSIC LIMITED, Germany). Samples were filtered with a
syringe filter to remove dust particles. To obtain the apparent hydrodynamic radius ($R_{h}$), the intensity autocorrelation functions were analyzed using CONTIN.
