Figure S10 Voltage and current outputs of the Au/PPy-SnO$_2$/Al system when Al electrode was used as the travelling electrode.
Figure S11 Open-circuit voltage and short-circuit current outputs of Au/PPy-SnO$_2$/Al device under continuous pressing-releasing impacts for 60 minutes (PPy thickness: 1.064 mm; SnO$_2$ thickness: 0.932 mm; strain level: 3.8%; compression speed: 0.02 mm/s).
Figure S12 Electric outputs of the Au/PPy-SnO$_2$/Al device at the reversed electrical connection.
Figure S13 Electric outputs change with different compression speeds.
Figure S14 Effect of compression conditions on electric outputs: (a) $t_1 = 100$ s, $t_2 = 300$ s; (b) $t_1 = 25$ s, $t_2 = 300$ s; (c) $t_1 = 300$ s, $t_2 = 100$ s; (d) $t_1 = 300$ s, $t_2 = 25$ s. Voltage (e) and current (f) outputs of the Au/PPy-SnO$_2$/Al device with a long holding time (~ 32 hours). (PPy plate thickness: 1.06±0.05 mm; SnO$_2$ plate thickness: 0.93±0.05 mm; strain level: 3.8%; Compression speed: 0.02 mm/s; external resistance: 100 kΩ)
Figure S15 Electric output signals of Au/PPy-SnO$_2$/Al system with different PPy plate thickness: (a) 1.327 mm; (b) 1.530 mm; (c) 1.789 mm and (d) 2.096 mm. (SnO$_2$ plate thickness: 0.932 mm; strain level: 3.8%; compression speed: 0.02 mm/s)
Figure S16 Electric output signals of Au/PPy-SnO$_2$/Al system with different SnO$_2$ plate thickness: (a) 1.124 mm; (b) 1.3mm; (c) 1.479 mm and (d) 1.809 mm. (PPy plate thickness: 1.064 mm; strain level: 3.8%; compression speed: 0.02 mm/s)
The sizes of PPy and SnO$_2$ plate were $\phi 13 \text{ mm} \times 1.20 \text{ mm}$ and $\phi 13 \text{ mm} \times 0.93 \text{ mm}$. The compression speed was controlled at 0.05 mm/min until the compression force reached 10000 N. According to the stress-strain curves as shown above, the modulus of PPy and SnO$_2$ plates was calculated, about 238.4 MPa and 335.2 MPa, respectively.
Figure S18 Electric output signals of Au/PPy-SnO$_2$/Al system with different plate areas: (a) 1.2 cm$^2$; (b) 0.74 cm$^2$; (c) 0.25 cm$^2$ and (d) 0.14 cm$^2$. (PPy plate thickness: 1.064 mm; SnO$_2$ plate thickness: 0.932 mm; strain level: 3.8%; compression speed: 0.02 mm/s)

Figure S25 The electric voltage output of Al/PPy-SnO$_2$/Au device under compression strain of 3.8%.
Figure S26 Proposed energy band equilibria of the Au/PPy-SnO$_2$/Au and Al/PPy-SnO$_2$/Al devices before and after compression test.

Figure S26 show the energy band equilibria of the Au/PPy-SnO$_2$/Au and Al/PPy-SnO$_2$/Al devices before and after compression test. As two non-Ohmic contacts were formed at the both sides of SnO$_2$ layer in Au/PPy-SnO$_2$/Au and also at the both sides of PPy layer in Al/PPy-SnO$_2$/Al devices, respectively, which play the opposite electron transport regulation functions, they resulted in generating AC electric outputs. Some phenomenon happens in the three non-Ohmic contact deice. Therefore, it is believed that single built-in non-Ohmic contact plays the critical role for the DC character of electric outputs generated by polymer-inorganic device.
Figure S27 The electric resistance change under a compressive impact up to 3.8%.

Figure S30 (a) Voltage and (b) current output of the Au/PPy-Al$_2$O$_3$/Al device. (PPy plate thickness: 1.064 mm; Al$_2$O$_3$ plate thickness: 0.936 mm; strain level: 3.8%; compression speed: 0.02 mm/s)
Figure S31 (a) Voltage and (b) current output of the Au/PPy-ZnO/Al device. (PPy plate thickness: 1.064 mm; ZnO plate thickness: 0.938 mm; strain level: 3.8%; compression speed: 0.02 mm/s)
Figure S32 (a) Voltage and (b) current output of the Au/PANi-SnO$_2$/Al device. (PANi plate thickness: 0.530 mm; SnO$_2$ plate thickness: 0.932 mm; strain level: 3.8%; compression speed: 0.02 mm/s)

PANi preparation method: Polyaniline was synthesized using a vapor phase polymerization method. In brief, FeCl$_3$ fine powder was placed in a glass dish in a vacuum chamber. Aniline was placed underneath the FeCl$_3$ plate. In vacuum, the monomer evaporated to fill the entire chamber in which polymerization tool place on FeCl$_3$ surface. After 48 hour reaction at room temperature, the synthetic powder was added to water and stirred for 48 hours to remove unreacted chemicals and any side products. The powder was then washed with distilled water for several times before drying in a vacuum oven at 60 °C. After drying, the conducting polymer was ground manually into finer powder and then pressed into plates using a steel die (7.5 tonnes for 3 minutes).
Figure S33 (a) Voltage and (b) current output of the Au/PEDOT-SnO$_2$/Al device. (PEDOT plate thickness: 0.530 mm; SnO$_2$ plate thickness: 0.932 mm; strain level: 3.8%; compression speed: 0.02 mm/s)

PEDOT was prepared by a similar method to PANi.
