Chemicals

The following chemicals were obtained as indicated: Zinc nitrate hexahydrate (Zn(NO$_3$)$_2$•6H$_2$O, 99.0%, Sigma-Aldrich), 2-methylimidazole (MIM, 99%, Sigma-Aldrich), Sodium tetrachloroaurate (NaAuCl$_4$, 99.0%, Tianjin Guangfu Company), Methanol (Tianjin Guangfu Fine Chemical Research Institute), Tetrabutylammonium iodide (TBAI) (Sigma-Aldrich), Acetone and ethanol (absolute for analysis, 99.9%, Tianjin Guangfu Fine Chemical Research Institute). All the chemicals are reagent-grade and used as received. High-purity water (18.25 MΩ·cm) supplied by a UP Water Purification System was used in all the experiments.
Characterization

Morphology of the samples was characterized with a transmission electron microscope (TEM) system (JEOL Model JEM-2100F) operating at 200 kV. The crystal phase of samples was investigated using a Bruker D8 Advance diffractometer X-ray diffraction (XRD) operating at 40 kV and 40 mA equipped with a nickel-filtered Cu Kα radiation (λ=1.54056 Å). X-ray photoelectron spectroscopy (XPS) data were obtained on a PHI-1600 instrument equipped with Al Kα radiation. Element composition was analyzed using a VISTA-MPX EL02115765 inductive coupled plasma optical emission spectrometer. The specific surface area was calculated by the Brunauer-Emmett-Teller (BET) method using nitrogen adsorption/desorption measurement (Quantachrome Instruments, Micrometrics TriStar 3000).

Synthesis of Au/Phen
Sodium tetrachloroaurate (65 mg) and 1,10-phenanthroline (Phen) (60 mg) were dissolved in 3.0 mL and 1.0 mL of acetone with stirring, respectively. Then the sodium tetrachloroaurate solution was added dropwise to the 1,10-phenanthroline solution with stirring, forming a yellow precipitate, and the mixture was kept stirring for 8 h at room temperature. The precipitate was separated by centrifugation, dried at 60 °C under vacuum for 8 h to yield Au/Phen as a yellow solid.
