Experimental Section

Measurements:

$^1$H and $^{13}$C-NMR spectra were recorded on a Bruker DPX-400 MHz FT-NMR, and peak multiplicity was reported as follows: s, singlet; d, doublet; t, triplet; m, multiplet. Elemental analyses were run in a Heraeus VarioEL-III CHNS elemental analyzer. Electrochemistry was performed with a CH Instruments 611B electrochemical analyzer. Voltammograms are presented with the positive potential pointing to the right and with increasing anodic currents pointing upwards. Cyclic voltammetry (CV) was conducted with the use of an optically transparent thin layer electrochemical (OTTLE) cell. All cell potentials were taken by using a homemade Ag/AgCl, KCl (sat.) reference electrode. Spectroelectrochemical experiments were carried out in a cell built from a 1 cm commercial UV–vis cuvette using Hewlett–Packard 8453 UV–vis diode array spectrophotometer. The CIELAB data were collected from JASCO V-650. The platinum net was used as the working electrode, while wire as the counter electrode, and an Ag/AgCl cell as the reference electrode. CE (η) determines the amount of optical density change (ΔOD) at a specific absorption wavelength induced as a function of the ejected/injected charge (Q; also termed as electroactivity) by the in situ experiments. CE is given by the equation: $\eta = \Delta OD/Q = \log[T_b/T_c]/Q$, where $\eta$ (cm$^2$/C) is the coloration efficiency at a given wavelength, Q means the injected charge, and $T_b$ and $T_c$ are the transmittance values for bleached and colored state, respectively.

1-Ethyl-[4,4′-bipyridin]-1-ium bromide (1)

\[
\begin{align*}
\text{N} & \quad \text{N} \\
\text{Br} & \quad \text{Br}
\end{align*}
\]

\[\text{Nucleophilic substitution} \quad \text{CH}_2\text{Cl}_2, \text{reflux, 48 hr} \]

\[\text{N} \quad \text{N} \]

\[\text{Br} \quad \text{a} \quad \text{b} \quad \text{c} \quad \text{d} \quad \text{e} \quad \text{f}
\]

10.0 g (64.0 mmol) of 4,4′-bipyridyl and 200 mL of dichloromethane were added to a 500 mL three-necked round-bottom flask equipped with a stirring bar and a reflux condenser. Then, 50.0 mL (80.0mmol) of ethyl bromide was dropped in the flask. The mixture was heated with stirring at reflux state for 48 hours when a white precipitate formed. The precipitated white solids were filtered out and dried to give 14.4 g (85 % in yield) of the product. Mp = 188-190 °C. 1H NMR (400 MHz, DMSO-d6, δ, ppm): 1.58 (t, 3H, H₃), 4.68-4.63 (qtet, 2H, H₄), 8.04 (d, 2H, H₅), 8.63 (d, 2H, H₆), 8.87 (d, 2H, H₇), 9.26 (d, 2H, H₈). These results agreed well with previous literature$^51$. 

SI-3
4-(tert-Butyldimethylsilanyloxy)phenylamine (2)

To a solution of 4-aminophenol (5.46 g, 50 mmol) and tert-butyl(chloro)dimethylsilane (55 mmol) in anhydrous dichloromethane (150 mL) was added 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) (80 mmol). The target mixture was stirred at room temperature under a nitrogen atmosphere for 20 minutes, as monitored by thin-layer chromatography (TLC). The solution was washed successively with water (100 mL), 0.1 M HCl (100 mL), and saturated aqueous NaHCO₃ (100 mL). The organic layer was dried over anhydrous MgSO₄ to acquire the product as brown oil (72% in yield). 1H NMR (400 MHz, DMSO-d₆, δ, ppm): 0.10 (s, 6H, H₉), 0.92 (s, 9H, H₉), 4.60 (s, 2H, H₉), 6.48 (d, 4H, H₉). These results agreed well with literature S².

4-[(tert-Butyl(dimethyl)silyloxy)-N,N-bis(4-methoxyphenyl)aniline (3)

Tris(dibenzylideneacetone)dipalladium(0) (Pd₂(dba)₃; 93.5 mg, 0.102 mmol), and tri-tert-butylphosphine (P(tBu)₃; 114 mg, 0.610 mmol) were dissolved in dry toluene (80 mL) under nitrogen atmosphere. After stirring for 10 minutes to provide chemical catalysis at room temperature, 4-bromoanisole (5.70 g, 30.5 mmol) was added to flask and stirred for next 10 minutes. 4-(tert-Butyldimethylsilanyloxy)phenylamine (2.27 g, 10.2 mmol), and sodium tert-butoxide (NaO-tBu; 2.34 g, 24.4 mmol) were successively put in the reactor. The solution was stirred at 100 °C for 15 h. After cooling to room tem, the reaction mixture was diluted with ethyl acetate (100 mL) and washed with brine (100 mL x 2). The organic layer was dried over MgSO₄. Evaporation and column chromatography (SiO₂, hexane/ethyl acetate = 4:1) afforded the desired product (2.1 g, 50 %) as a yellow solid. mp: 69-70 °C (by Melting Point System at a
scan rate of 5 °C/min). (400 MHz, DMSO-$d_6$, δ, ppm): 0.17 (s, 6H, $H_f$), 0.94 (s, 9H, $H_g$), 3.71 (s, 6H, $H_a$), 6.75 (d, 4H, $H_{e+d}$), 6.86 (d, 8H, $H_{b+c}$). These results agreed well with literature$^S2$.

4-[Bis(4-methoxyphenyl)amino]phenol (4)

To a solution of 4-{(tert-butyl(dimethyl)silyl)oxy}-N,N-bis(4-methoxyphenyl)aniline (3.01 g, 6.90 mmol) in THF (60 mL), tetrabutylammonium fluoride (1 M in THF, 7 mL) was added under nitrogen atmosphere. The mixture was stirred at 20 °C for 20 min monitored by TLC and then washed with water and ethyl acetate. After drying with rotary evaporator, it obtained the target product (2.0 g, 90 % in yield) as brown oil. (400 MHz, DMSO-$d_6$, δ, ppm): 3.69 (s, 6H, $H_a$), 6.68 (d, 2H, $H_e$), 6.80 (m, 10H, $H_{b+c+d}$), 9.19 (s, 1H, $H_f$). These results agreed well with literature$^S2$.
