surface/inner border. (C) Obvious moderate undulated surface/inner border. (D) Disruption of the surface/inner border. H&E 10x.

**IR-ATR spectra of human menisci sample**

Attenuated total reflection infrared spectroscopy spectra were recorded via a Bruker Alpha FT-IR spectrometer equipped with a single-reflection ATR module (Platinum ATR). Spectra were acquired in the spectral range 4000-800 cm$^{-1}$ with a spectral resolution of 2 cm$^{-1}$ as an average of 500 spectral scans. Figure S2 depicts an example of a raw IR-ATR spectra obtained for a meniscus sample with grade 3 degeneration. For further analysis, spectra were subjected to smoothing and baseline correction prior second derivative Gaussian peak-fit model.

**Figure S2.** IR-ATR spectrum in the region 4000-800 cm$^{-1}$ of a meniscus samples with grade 3 degeneration.
