**General.** Infrared (IR) spectra were recorded on Bruker Tensor II FT-IR Spectrometer, $\nu_{\text{max}}$ in cm$^{-1}$. Bands are characterized as broad (br), strong (s), medium (m), and weak (w). $^1$H NMR spectra were recorded at room temperature on a Varian I400 (400 MHz), Varian VXR400 (400 MHz), Varian I500 (500 MHz), or a Varian I600 (600 MHz) spectrometer. Chemical shifts are reported in ppm from tetramethylsilane with the solvent resonance as the internal standard (CHCl$_3$: $\delta$ 7.26 ppm). Data are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, br = broad, m = multiplet), coupling constants (Hz), and integration. $^{13}$C NMR spectra were recorded on a Varian I400 (100 MHz) and Varian I500 (125 MHz) spectrometer with complete proton decoupling. Chemical shifts are reported in ppm from tetramethylsilane with the solvent resonance as the internal standard (CDCl$_3$: $\delta$ 77.16 ppm). High-resolution mass spectrometry (HRMS) was performed on a Thermo Electron Corporation MAT 95XP-Trap (GC/MS). Melting points were obtained on a Thomas Hoover capillary melting point apparatus without correction. Unless otherwise noted, all reactions have been carried out with distilled and degassed solvents under an atmosphere of dry N$_2$ in oven- (135 °C) and flame-dried glassware with standard vacuum-line techniques. Toluene was purified under a positive pressure of dry argon by passage through columns of activated alumina and Q5 (Grubbs apparatus). All work-up and purification procedures were carried out with reagent grade solvents (purchased from Sigma-Aldrich) in air. Standard column chromatography techniques using ZEOprep 60/40-63 µm silica gel were used for purification.

**Control Reactions**

To verify that the reaction is catalyzed by Cu, several control reactions were performed, as shown in Table 1. Note that the Cu(I) sources and PCy$_3$ were used individually in these reactions, instead of using pre-ligated Cu complexes, as this does not have a significant effect on yield (Table 1, entries 1-2). No product was observed in the absence of CuCl, though moderate yield of product was obtained in the absence of PCy$_3$ (Table 1, entries 3-5). To investigate whether the reaction is catalyzed by other metal contaminants, various sources of Cu(I) in high purity were attempted, including CuCl from different suppliers (Table 1, entry 6) as well as CuBr and CuI (Table 1, entry 7 and 8, respectively). Additionally, high purity NaOt-Bu was used in a control reaction (Table 1, entry 9). All of these reactions provided the desired product in excellent yield.

$^a$ Yield determined by analysis of the crude $^1$H NMR with an internal standard.

General Procedure A: Coupling of aryl bromides and aryl boronic esters
In an N₂ filled glovebox, to a 13 x 100 mm screw-capped vial was added PCy₃-CuCl (3.80 mg, 10.0 µmol, 2.00 mol%), boronic ester (0.750 mmol, 1.50 equiv), NaOt-Bu (72.1 mg, 0.750 mmol, 1.50 equiv). The vial was sealed with a rubber septum and then removed from the glovebox. Aryl bromide (0.50 mmol, 1.5 equiv) was added via microsyringe and was immediately followed by addition of 0.50 mL (1.00 M) of toluene via syringe. Note: If the aryl bromide is a solid, it was added in the glovebox. The septum was quickly replaced with a Teflon-lined screw cap and the vial placed in a preheated 100 °C aluminum heating block and allowed to stir for 15 hours. The reaction was then quenched upon addition of H₂O (1.0 mL) and the mixture was extracted with EtOAc (3 x 1.0 mL). The combined organic layers were concentrated via rotovap. The residue was purified by silica gel column chromatography to obtain the desired product.

General Procedure B: Coupling of aryl bromides and alkyl boronic esters
In an N₂ filled glovebox, to a 13 x 100 mm screw-capped vial was added SIMes-CuCl (10.1 mg, 25.0 µmol, 5.00 mol%), alkyl boronic ester (0.750 mmol, 1.50 equiv), NaOt-Bu (72.1 mg, 0.750 mmol, 1.50 equiv). The vial was sealed with a rubber septum and then removed from the glovebox. Aryl bromide (0.500 mmol, 1.5 equiv) was added via microsyringe and was immediately followed by addition of 0.50 mL (1.00 M) of toluene via syringe. Note: If the aryl bromide is a solid, it was added in the glovebox. The septum was quickly replaced with a Teflon-lined screw cap and then placed in a preheated 140 °C aluminum heating block and allowed to stir for 15 hours. The reaction was then quenched upon addition of H₂O (1.0 mL) and the mixture was extracted with EtOAc (3 x 1.0 mL). The combined organic layers were concentrated via rotovap. The residue was purified by silica gel column chromatography to obtain the desired product.

General Procedure C: Coupling of aryl bromides and alkyl-9-BBN reagents
In an N₂ filled glovebox, to a 13 x 100 mm screw-capped vial was added SIMes-CuCl (10.1 mg, 25.0 µmol, 5.00 mol%) and NaOt-Bu (72.1 mg, 0.750 mmol, 1.50 equiv). The vial was sealed with a rubber septum and then removed from the glovebox. Aryl bromide (0.500 mmol, 1.5 equiv) was added via microsyringe and was immediately followed by
addition of a solution of alkyl-9-BBN (0.750 mmol, 1.50 equiv) in 0.50 mL of toluene via syringe. The septum was quickly replaced with a Teflon-lined screw cap and then placed in a preheated 140 °C aluminum heating block and allowed to stir for 15 hours. The reaction was then quenched upon addition of H₂O (1.0 mL) and the mixture was extracted with EtOAc (3 x 1.0 mL). The combined organic layers were concentrated via rotovap. The residue was purified by silica gel column chromatography to obtain the desired product.
