1. General Information

All catalytic experiments were carried out using standard Schlenk techniques. All solvents were reagent grade or better. Deuterated solvents were used as received. Toluene was refluxed over sodium/benzophenaketone and distilled under argon atmosphere and stored over sodium. Metal complexes and other chemicals used in catalysis reactions were used without additional purification. Thin layer chromatography (TLC) was performed using silica gel precoated glass plates, which were visualized with visualized with UV light at 254 nm or under iodine. Column chromatography was performed with SiO\textsubscript{2} (SilicycleSiliaflash F60 (230-400 mesh). \textsuperscript{1}H NMR (400 or 500 MHz), \textsuperscript{13}C\{\textsuperscript{1}H\} NMR (100 MHz) spectra were recorded on the NMR spectrometer. Deuterated chloroform was used as the solvent, and chemical shift values (δ) are reported in parts per million relative to the residual signals of this solvent [δ 7.26 for \textsuperscript{1}H (chloroform-d), δ 77.2 for \textsuperscript{13}C\{\textsuperscript{1}H\} (chloroform-d). Abbreviations used in the NMR follow-up experiments: br, broad; s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet. GC analysis was carried out using a HP-5 column (30 m, 0.25 mm, 0.25μ). Mass spectra were obtained on a GCMS-QP 5000 instruments with ionization voltages of 70 eV. High resolution mass spectra (HRMS) were obtained on a High-resolution mass spectra (HRMS) were obtained by fast atom bombardment (FAB) using a double focusing magnetic sector mass spectrometer and electron impact (EI) ionization technique (magnetic sector-electric sector double focusing mass analyzer). HPLC analysis was performed on Agilent Technologies 1260 Infinity with UV detector.

2. Experimental Section

2.1 Synthesis of the Starting Materials

Picolinamides were prepared by the reaction of picolinic acid with the corresponding amines.\textsuperscript{S1,S2,S3} The (bromoethynyl)triisopropylsilane (2) was prepared by previously reported AgNO\textsubscript{3}-catalyzed bromination of (triisopropylsilyl)acetylene with N-bromosuccinimide.\textsuperscript{S4}
2.2 General Procedure

To an oven-dried 10 mL screw-capped vial, picolinamide (0.25 mmol), (bromoethyl)triisopropylsilane 2 (0.27 mmol), Pd(OAc)$_2$ (10 mol%), Ag$_2$CO$_3$ (2 equiv), and toluene (1 mL) were added under a gentle stream of argon. The mixture was stirred for 18 hrs at 130 °C (bath temperature) followed by cooling to room temperature. The mixture was filtered through a celite pad with several washings (3 x 3 mL dichloromethane) and concentrated in vacuo. The residue was purified by column chromatography on silica gel (eluent: pet ether/EtOAc) to afford the desired alkynylated product 3.

3. Synthetic Application

Synthesis of 4a (Removal of Directing Group)

To a suspension of the starting 3a (0.15 mmol, 1.0 equiv) in THF (1.5 mL) was added water (1.5 mL) followed by 12M HCl (0.37 mL) and the mixture was stirred for 5 minutes at rt. Zinc dust (145 mg, 2.24 mmol, 15 equiv) was then added in three portions and the mixture was stirred at rt. After 1.5 h, the reaction was filtered through a celite plug. The filtrate was transferred to a separating funnel with 2M NaOH (50 mL) and extracted twice with DCM (2 x 50 mL). The combined organic phase was dried over Na$_2$SO$_4$ and concentrated in vacuo. The residue was purified by column chromatography on silica gel (eluent: MeOH/DCM) to afford the desired product 4a (33 mg, 80%, yellow liquid).

Synthesis of 4b

To an oven-dried 10 mL screw-capped vial, amide3a (38 mg, 0.1 mmol), ethyl acrylate (20 mg, 0.15 mmol), [Cp*RhCl$_2$]$_2$ (5 mol%), Cu(OAc)$_2$ (2 equiv), and toluene (1 mL) were added under a gentle stream of argon. The mixture was stirred for 24 hrs at 130 °C (bath temperature) followed by cooling to room temperature. The mixture was filtered through a celite pad with several washings (3 x 3 mL dichloromethane) and concentrated in vacuo. The residue
was purified by column chromatography on silica gel (eluent: pet ether/EtOAc) to afford the desired product 4b (34 mg, 72%, yellow liquid).

**Synthesis of 4c**

The corresponding compound 3a (500 mg, 1.3 mmol) was dissolved in THF and 1.0 M TBAF in THF (1.5 equiv) was then added at 0 °C with constant stirring. The reaction progress was monitored by TLC. The mixture was diluted with water extracted with EtOAc, dried over anhydrous Na₂SO₄, filtered and evaporated *in vacuo*. The obtained crude product was purified by column chromatography to afford the desired terminal alkyne 4c (294 mg, 99%, yellow liquid).

**Synthesis of 4e**

Under argon atm, 3a (prepared by the above mentioned procedure) (34 mg, 0.15 mmol), iodobenzene (39 mg, 0.18 mmol), PdCl₂ (5 mol%), CuI (2.5 mol%), Et₃N (1 mL) were charged to a 25 mL Schlenk tube. The reaction mixture was stirred at 50 °C for 12 hrs. The mixture was filter through celite and concentrated *in vacuo*. The obtained crude product was purified by column chromatography to afford 4e (43 mg, 90%, white solid).

**Synthesis of 4d**

Under argon atm, 3a (34 mg, 0.15 mmol, 1.0 equiv), CuI (10 mol %) and 3-methyl benzyl azide (20 mg, 0.15 mmol, 1.0 equiv) were dissolved in DMF (1 mL) and stirred at 60 °C for 16 hrs. After completion of the reaction saturated aq. NH₄Cl solution (5 mL) was added and the mixture was extracted with dichloromethane (3 x 5 mL) and dried over anhydrous Na₂SO₄. After complete evaporation of the solvent, the obtained crude product was purified by column chromatography to afford 4d (49 mg, 87%, yellow solid).
4 Rate Order Determination

The rate order of the alkynylation reaction with various reaction components was determined by the initial rate method. The data of the concentration of the product vs time (min) plot was fitted linear with Origin Pro 8. The slope of the linear fitting represents the reaction rate. The order of the reaction was then determined by plotting the log(rate) vs log(conc) for a particular component.

5.1 Rate order determination for 3a.

To determine the order of the alkynylation reaction on 1a, the initial rates at different initial concentrations of 1a were recorded. The final data was obtained by averaging the results of three independent runs for each experiment.

To an oven-dried 10 mL screw-capped vial, (bromoethynyl)triisopropylsilane 2 (71 mg, 0.27 mmol), Pd(OAc)$_2$ (6 mg, 10 mol%), AgOAc (149 mg, 2 equiv), specific amount of 1a (as shown in table S1), n-decane (38.4 mg, 0.27 mmol) as internal standard and toluene (2 mL) were added under a gentle stream of argon. The mixture was stirred at 130 °C (bath temperature). At regular intervals, the reaction vessel was cooled to ambient temperature and an aliquot of sample was withdrawn to the GC vial. The sample was diluted with EtOAc and subjected to GC analysis. The concentration of the product 3a obtained in each sample was determined with respect to the internal standard n-decane.

Table S1. Rate of cobalt-catalyzed alkynylation reaction at different initial concentration of 1a.

5.2 Rate order determination for (bromoethynyl)triisopropylsilane (2).

To determine the order of the alkynylation reaction on (bromoethynyl)triisopropylsilane (2), the initial rates at different initial concentrations of (bromoethynyl)triisopropylsilane were recorded. The final data was obtained by averaging the result of three independent runs for each experiment.

Representative procedure was followed, employing 1a (80 mg, 0.27mmol), Pd(OAc)$_2$ (6 mg, 10 mol%), AgOAc (149 mg, 2 equiv), specific amount of (bromoethynyl)triisopropylsilane 2 (as shown in table S2), n-decane (38.4 mg, 0.27 mmol) as internal standard and toluene (2 mL).
