1. General Information

a. Materials
All reagents and solvents were obtained from the Peptide Institute, Inc. (Osaka, Japan), Wako Pure Chemical Industries, Ltd. (Osaka, Japan), Tokyo Chemical Industry Co., Ltd. (Tokyo, Japan), Nacalai Tesque, Inc. (Kyoto, Japan), Watanabe Chemical Industries, Ltd. (Hiroshima, Japan), Merck KGaA (Darmstadt, Germany) and Sigma-Aldrich Co. LLC. (St. Louis, MO). *Notice: During handling Can-peptides, fresh reagents and solvents should be used to avoid undesired oxime-based side product formation.

b. HPLC, MS and NMR
Preparative HPLC was carried out on a Shimadzu liquid chromatograph Model LC-8A (Kyoto, Japan) with a YMC-Pack ODS-A (30 x 250 mm) and the following solvent systems: 0.1% TFA in H₂O and 0.1% TFA in CH₃CN at a flow rate of 20 mL min⁻¹ with detection at 220 nm. Analytical HPLC was performed on a Shimadzu liquid chromatograph Model LC-10A (Kyoto, Japan) with a DAIOS-PACK SP-120-5-ODS-BIO (4.6 x 150 mm) or a YMC-Pack ODS-A (4.6 x 150 mm) and the following solvent systems: 0.1% TFA in H₂O and 0.1% TFA in CH₃CN at a flow rate of 1 mL min⁻¹ (40 °C) with detection at 220 nm. Low resolution mass spectra (LRMS) were observed with an Agilent G1956B LC/MSD detector using an Agilent 1100 series HPLC system; observed masses (most abundant masses) were derived from the experimental m/z values for each protonation states of a target peptide. ¹H NMR spectrum was recorded on a JEOL-ECX400 spectrometer (Tokyo, Japan) in DMSO-d₆ with the solvent residual peak as an internal reference.

c. SPPS
Automated peptide synthesis by Boc SPPS was performed on an ABI 433A (Applied Biosystems, USA) peptide synthesizer. The peptide chain was elongated using in situ neutralization protocols.[¹] Automated peptide synthesis by Fmoc SPPS was performed on an ABI 433A peptide synthesizer. The peptide chain was elongated using the coupling protocol of Fmoc-amino acid/DIC/OxymaPure.[²] The acetyl capping was performed using acetic anhydride/NMP in the presence of DIEA after each coupling step. The following side-chain-protected amino acids were employed: Arg(Pbf), Asn(Trt), Asp(OrBu), Can(2-Cl-Trt), Cys(Trt), Glu(OrBu), Gln(Trt), His(Trt), Lys(Aloc), Lys(Boc), Orn(Boc), Ser(tBu), Trp(Boc), Tyr(tBu). Boc-amino acids were selected as N-terminal amino acids, when using MeNbz linker and/or Lys(Aloc). Fmoc-Can(2-Cl-Trt) (3 equiv) was condensed using DIC/OxymaPure (3/3 equiv) in NMP for 14-20 h without using the
automated peptide synthesizer.

**Desulfurization of a Can-containing peptide (17).**
LYRK(GK\_Can)ANFCSPGYS-NH\_2 17 (1.0 mg) was treated by conventional TCEP-VA-044-mediated method\(^{[5]}\) and TCEP-NaBH\_4-mediated method\(^{[6]}\), respectively. Then, the solutions were monitored by analytical HPLC (5–45% CH\_3CN/0.1% TFA for 25 min). However, majority of MS values of the observed peaks were not that of a desired product.

**Figure S28.** Analytical HPLC chromatograms of desulfurization: a) \(t = 0\) h, b) TCEP-VA-044-mediated method \((t = 3\) h\), c) TCEP-NaBH\_4-mediated method \((t = 16\) h\). Both desulfurization reactions did not proceed because of many side reactions. Observed MS value: A) M+H = 2015 (-15 Da: cleavage of N-O bond), B) 2248 (+218 Da), C) 2100 (+70 Da), D) 2056 (+26 Da), desired product (M+H: 2030).
