1. General Information

**Reagents:**
All reagent-grade chemicals were obtained from commercial suppliers and were used as received unless otherwise noted. CH₂Cl₂ and THF were dried over activated alumina columns on MBraun Solvent Purification System (SPS-800). DCE, MeCN were distilled from CaH₂ and anhydrous dimethylformamide, dimethylsulfoxide triethylamine (reagent grade, ≥98%) and DMSO (anhydrous, ≥99.9%) were purchased from Sigma Aldrich.

**Reactions:** All reactions for the Visible-Light Photocatalyzed Oxidation of Oxamic Acids were set up on bench-top in the open air and carried out in re-sealable test tubes with Teflon septa under an argon atmosphere. Unless otherwise noted, the reaction test tubes were cooled to room temperature prior to other operations. Unless otherwise noted, the solvents and the solutions of reagents/reactants were transferred via microsyringe or plastic syringe (fitted with metal needle) into the reaction test tubes under a positive argon pressure.

Photochemical reactions were performed with 455 nm blue LEDs (λ = 455 nm (± 15nm), 12 V, 500 mA).

Analytical thin layer chromatography was performed using silica gel 60 F254 pre-coated plates (Merck) with visualization by ultraviolet light, ceric Ammonium molybdate and ninhydrin. Flash chromatography was performed on silica gel (0.043-0.063 mm). Yields refer to chromatographically and spectroscopically (¹H-NMR) homogeneous materials, unless otherwise stated.

**Instruments:** ¹H-NMR and ¹³C-NMR were recorded on various spectrometers: a Bruker DPX 200 (¹H: 200 MHz, ¹³C: 50.25 MHz), a Bruker Avance 300 (¹H: 300 MHz, ¹³C: 75.46 MHz), a Bruker DRX400 (¹H: 400 MHz, ¹³C: 100.6 MHz) and a Bruker Avance 600 (¹H: 600 MHz, ¹³C: 150.9 MHz) using CDCl₃ as internal
reference unless otherwise indicated. The chemical shifts (δ) and coupling constants (J) are expressed in ppm and Hz respectively. The following abbreviations were used to explain the multiplicities: bs = broad singlet, s = singlet, d = doublet, t = triplet, q = quartet, dd = doublet of doublets, m = multiplets. FTIR spectra were recorded on a Perkin-Elmer Spectrum 100 using a diamond NEAT accessory. HRMS were recorded with a Waters Q-TOF 2 spectrometer in the electrospray ionization (ESI) and APCI mode.

To a solution of the corresponding aniline or amine (10 mmol) in CH₂Cl₂ (0.3 M) was added Et₃N (11 mmol) and ethyl oxalyl chloride (11 mmol) was then added to the solution slowly at 0°C. The reaction mixture was warmed to room temperature and stirred for 4 - 6 h. The reaction mixture was then treated with 1 M HCl (20 mL) and extracted with dichloromethane (3 x 20 mL). The combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated in vacuo, directly subjected to hydrolysis.

The residue was dissolved in THF (15 mL) and H₂O (5 mL), and LiOH (50 mmol) was added. After stirring for 6 - 8 h at room temperature, the basic reaction mixture was washed with dichloromethane (3 x 30 mL). The aqueous phase was separated and acidified with 1M aqueous HCl solution. The resulting mixture was extracted with ethyl acetate (3 x 30 mL) and the combined organic layers were washed with brine (30 mL) and dried over Na₂SO₄. The solvent was evaporated and the residue recrystallized by CH₂Cl₂/hexanes.

3. Synthesis of 1,2,3,5-tetrakis(carbazol-9-yl)-4,6-dicyanobenzene (4CzIPN)

4CzIPN was synthesized according to the following reported procedure.\(^8\) NaH (60% in oil, 1.4 g, 60 mmol) was added slowly to a stirred solution of carbazole (4.18 g, 25.0 mmol) in dry THF (100 mL) under a nitrogen atmosphere at room temperature. After 30 min, tetrafluoroisophthalonitrile (1.0 g, 5.0 mmol), was added. After stirring at room temperature for 12 h, 4-5 mL water was added to the reaction mixture to quench the excess NaH. The resulting mixture was then concentrated under reduced pressure and successively washed by water and EtOH to yield the crude yellow solid. The crude product was dissolved in the minimum quantity of CH\(_2\)Cl\(_2\) and crystallized by addition of pentane to give pure 4CzIPN (2.21 g, 66% ) as a yellow solid; \(^1\)H NMR (300 MHz, CDCl\(_3\)) \(\delta 8.25\) (dt, \(J = 7.8, 1.0\) Hz, 2H), \(7.80 - 7.66\) (m, 8H), \(7.57 - 7.47\) (m, 2H), \(7.36\) (d, \(J = 7.6\) Hz, 1H), \(7.32 - 7.21\) (m, 5H), \(7.19 - 7.05\) (m, 8H), \(6.91 - 6.79\) (m, 4H), \(6.73 - 6.60\) (m, 2H). \(^1^3\)C NMR (75 MHz, CDCl\(_3\)) \(\delta 145.23, 144.63, 140.00, 138.19, 136.97, 134.77, 126.98, 125.79, 124.97, 124.76, 124.54, 123.86, 122.41, 121.95, 121.42, 121.00, 120.44, 119.67, 116.37, 111.64, 109.97, 109.49, 109.44. **Catalyst Stability**

Solutions of oxamic acid 1a (9.6 mg, 0.05 mmol), BI-OAc (23.0 mg, 0.07 mmol), 4CzIPN (10.0 mol%, 3.9 mg) and dibromomethane (0.003 mL, 0.05 mmol) as an internal standard in 0.6 mL CDCl$_3$ were added into an NMR tube. The reaction was monitored by $^1$H NMR at 0 h and 12 h. After 12 h, the reaction was completed and $^1$H NMR indicated that 4CzIPN catalyst was still present in the reaction mixture.
Attempt a detecting intermediate 12. The BI-OAc and Oxamic Acid $^1$H NMR Experiment

Solutions of oxamic acid 1a (4.8 mg, 0.025 mmol) and BI-OAc (11.4 mg, 0.03 mmol) in 0.6 mL CDCl$_3$ were added into an NMR tube. After 5 mins, $^1$H NMR was recorded and showed that the oxamic acid reacted with the hypervalent iodine reagent to generate acetic acid and a new compound which could not be isolated but might be 12.

Formation of Isocyanate monitored by $^1$H NMR

Solutions of oxamic acid 1a (4.8 mg, 0.025 mmol), BI-OAc (11.4 mg, 0.03 mmol) and 4CzIPN (1.0 mol%, 0.2 mg) in 0.6 mL CDCl$_3$ were added into an NMR tube. The mixture was monitored by $^1$H NMR at 0 h and 6 h. At 0 h, the complexation of oxamic acid and BIOAc was observed as in previous experiment above. After 6 h, the signal of the benzyl CH (around 5 ppm) shifted to upfield (4.75 ppm) the chemical shift being identical with that of an authentic isocyanate NMR spectrum. 2-Iodobenzoic acid and AcOH peaks also emerged.
