I- General information

Unless otherwise stated, all reactions were conducted in dried (under vacuum) flask and under an atmosphere of dry argon gas. DMPU and TMEDA were distilled over CaH₂ under argon. THF was distilled over sodium/benzophenone under argon. Acetone was purchased with water < 50 ppm. All other reagents were used as received. Potassium bis(trimethylsilyl)amide was used as commercial THF solution (1.0 M). Flash chromatography was performed on 60M silica (0.040-0.063 mm).

Infrared spectra were recorded on ATER-FT-IR spectrophotometer. ¹H NMR spectra were measured at 250, 300, or 360 MHz using CDCl₃, D₂O or DMSO-d₆ as solvent. Chemical shifts are reported in δ units to 0.01 ppm precision with coupling constants reported to 0.1 Hz precision using residual solvent as an internal reference. Multiplicities are reported as follows: s = singlet, d = doublet, t = triplet, m = multiplet, q = quadruplet, bs = broad singlet. ¹³C NMR spectra were measured at 62.5, 75 or 90 MHz using CDCl₃ as solvent. Chemical shifts are reported in δ units to 0.1 ppm precision using residual solvent as an internal reference. Mass spectra were measured on a MAT95S Finnigan-Thermo spectrometer at the Institut de Chimie Moléculaire et des Matériaux (ICMMO) Mass Spectrometry Laboratory. HPLC analyses were conducted on Dionex instrument (Ultimate 3000) in our laboratory. This instrument is principally composed of gradient pump, Peltier effect column oven and Diodes array detector. HPLC conditions were determined by injection of racemic. All enantiomers excesses were determinated by normal phase HPLC analyses with four different chiral stationary phase columns:

-Column Chiralpack AD-H (250 mm x 4.6 mm id); particules size : 5 µm
-Column Régis Type ‘Pirkle’, (S,S) Whelk-O 1 (250 mm x 4.6 mm id); particules size : 5 µm
-Column Chiralpack IC (250 mm x 4.6 mm id); particules size : 5 µm
-Column Chiralpack IF-3 (250 mm x 4.6 mm id); particules size : 5 µm

Notes: all the experimental procedures listed below are applied to both racemic and enantiomerically pure material. Only the preparations of chiral compounds are reported. For all the compounds, there exist at least two conformers and these conformers are reported for the ¹H NMR as major (M) and the minor (m). For simplicity, this notation is excluded for the carbon interpretation. To prove that there are really conformers and not atropoisomers, we performed Variable-Temperature NMR (VT-NMR), see part VI (page S44).

![ORTEP drawing of compound 3a](image)

Fig. S1. An ORTEP drawing of compound 3a. Thermal ellipsoids are shown at the 30% level.

X-ray diffraction data for compound 3a was collected by using a VENTURE PHOTON100 CMOS Bruker diffractometer with Micro-focus λμS source CuKα radiation. Crystals were mounted on a CryoLoop (Hampton Research) with Paratone-N (Hampton Research) as cryoprotectant and then flashfrozen in a nitrogen-gas stream at 100 K. For compound, the temperature of the crystal was maintained at the selected value by means of a 700 series Cryostream cooling device to within an accuracy of ±1K. The data were corrected for Lorentz polarization, and absorption effects. The structures were solved by direct methods using SHELXS-97\(^{[11]}\) and refined against \(F^2\) by full-matrix least-squares techniques using SHELXL-2013\(^{[12]}\) with anisotropic displacement parameters for all non-hydrogen atoms. Hydrogen atoms were located on a difference Fourier map and introduced into the calculations as a riding model with isotropic thermal parameters. All calculations were performed by using the Crystal Structure crystallographic software package WINGX.\(^{[13]}\)

The crystal data collection and refinement parameters are given in Table X1.

CCDC 1851456 contains the supplementary crystallographic data for this paper. These data can be obtained free of charge from the Cambridge Crystallographic Data Centre via http://www.ccdc.cam.ac.uk/Community/Requestastructure.
