#### Appendix 1. Experimental section.

## Solvents and starting materials

2,2':6',2"-terpyridine (tpy) is commercially available. N,N'-dimethyl-N,N''-dipyridin-2ylpyridine-2,6-diamine (ddpd),<sup>10</sup> 4'-carbethoxy-2,2':6',2"-terpyridine (tpy-COOEt),<sup>21</sup> [Cr(tpy)Cl<sub>3</sub>],<sup>19</sup> [Cr(ddpd)Cl<sub>3</sub>],<sup>17</sup> [Cr(ddpd)<sub>2</sub>](BF<sub>4</sub>)<sub>3</sub><sup>10</sup> and [Cr(tpy)<sub>2</sub>](PF<sub>6</sub>)<sub>3</sub><sup>18</sup> were synthetized according to published procedures. Reagent grade acetonitrile (ACN) and chloroform were distilled from CaH<sub>2</sub> when needed. All other chemicals were purchased from commercial suppliers and used without further purification.

#### Synthesis of heteroleptic complexes.

Method 1: Ligand substitution in trifluoromethane sulfonic acid (Scheme 1).<sup>17</sup>

 $[Cr(tpy)(ddpd)](PF_6)_3$ . Ligand ddpd (0.1 g, 1.1 eq, 0.343 mmol) was added under N<sub>2</sub> atmosphere into a Schlenk containing a solution of  $[Cr(tpy)(SO_3CF_3)_3]$  (0.230 g, 1 eq, 0.312 mmol)<sup>17</sup> in acetonitrile (15 mL),. The mixture was heated at 75°C during 4 hours. After cooling down the reaction mixture, solvent was evaporated under reduced pressure. The obtained orange residue was then dissolved in ethanol (1.5 mL) and few drops of a saturated methanol solution of (n-Bu<sub>4</sub>)NPF<sub>6</sub> were added. The yellow precipitate was filtered, washed with diethyl ether (2 x 15 mL) and dried under vacuum to give  $[Cr(tpy)(ddpd)](PF_6)_3$  (yield 60%).

Method 2: Ligand substitution in acetonitrile (Schemes 2-3).

[Cr(ddpd)Br<sub>3</sub>]. A solution of the ligand ddpd (370 mg, 1.26 mmol) in propan-2-ol (30 mL) was dropwise added into a solution of CrBr<sub>3</sub>·6H<sub>2</sub>O (520 mg, 1.3 mmol) in 15 mL of the same solvent. The resulting green solution was heated to reflux during 10 h. The mixture was filtered and the green solid was washed with warm ethanol (2 x 10 mL) and diethyl ether (2 x 20 mL). The product was dried under vacuum to obtain an olive drab powder [Cr(ddpd)Br<sub>3</sub>] (yield 90%). ESI-MS (CH<sub>3</sub>CN) m/z: [Cr(ddpd)Br<sub>2</sub>]<sup>+</sup> calc: 502.92, found: 502.9. Slow diffusion of diethyl ether into a concentrated solution of the complex in dimethylformamide led to the formation of green crystals suitable for X-ray diffraction.

[Cr(tpy)Br<sub>3</sub>]. A solution of the ligand tpy (293 mg, 1.26 mmol) in propan-2-ol (30 mL) was dropwise added into a solution of CrBr<sub>3</sub>·6H<sub>2</sub>O (520 mg, 1.3 mmol) in 15 mL of the same solvent. The resulting green solution was refluxed for 10 h. The resulting mixture was filtered and the green solid was washed with warm ethanol (2 x 10 mL) and diethyl ether (2 x 20 mL). The product was dried under vacuum to obtain a dark green powder [Cr(tpy)Br<sub>3</sub>] (yield 88%). ESI-MS (CH<sub>3</sub>CN) m/z: [Cr(tpy)Br<sub>2</sub>]<sup>+</sup> calc: 444.87, found: 444.9.

 $[Cr(ddpd)(SO_3CF_3)_3]$ . A mixture of  $[Cr(ddpd)Br_3]$  (100 mg, 0.17 mmol) and AgCF\_3SO\_3 (132 mg, 0.51 mmol) in distilled acetonitrile (4 mL), was heated under microwave irradiation in a sealed cap at 150°C during 0.5 h. After cooling to room temperature, the resulting red solution was filtered to remove the AgBr generated during the reaction. ESI-MS (CH<sub>3</sub>CN) *m/z*:  $[Cr(ddpd)(SO_3CF_3)_2]^+$  calc: 640.99, found: 641. This solution was used directly for the next step.

 $[Cr(tpy)(SO_3CF_3)_3]$ . A mixture of  $[Cr(tpy)Br_3]$  (0.089 mg, 0.17 mmol) and AgCF\_3SO\_3 (132 mg, 0.51 mmol) in distilled acetonitrile (4 mL) was heated under microwave irradiation in a sealed cap at 150°C for 0.5 h. After cooling to room temperature, the resulting red solution was filtered in order to remove the AgBr generated during the reaction. ESI-(CH<sub>3</sub>CN) *m/z*:  $[Cr(tpy)(SO_3CF_3)_2]^+$  calc: 582.94, found: 582.8. This solution was used directly for the next step.

[Cr(ddpd)(tpy)](PF<sub>6</sub>)<sub>3</sub>. A red solution of either [Cr(ddpd)(SO<sub>3</sub>CF<sub>3</sub>)<sub>3</sub>] or [Cr(tpy)(SO<sub>3</sub>CF<sub>3</sub>)<sub>3</sub>] in distilled acetonitrile was loaded into a 5 ml MW vial containing the ligand tpy (42 mg, 0.18 mmol), ddpd (51 mg, 0.18 mmol) respectively. The solution was heated under microwave irradiation for 2h at 75°C. After cooling to room temperature, the solvent was removed under reduced pressure yielding orange residue. ESI-MS (CH<sub>3</sub>CN) m/z: an [Cr(ddpd)(tpy)](SO<sub>3</sub>CF<sub>3</sub>)<sub>2</sub>]<sup>+</sup> calc: 874.09, found: 874. The orange residue was dissolved in ethanol (2 mL) and few drops of a saturated methanol solution of (n-Bu<sub>4</sub>)NPF<sub>6</sub> were added. The resulting yellow precipitate was filtered and washed with cold MeOH (1 x 5 mL) and diethyl ether (2 x 15 mL) and finally dried under vacuum to give [Cr(ddpd)(tpy)](PF<sub>6</sub>)<sub>3</sub> (yield 45% and 50%, respectively). Slow diffusion of diethyl ether into a concentrated solution of the complex in acetonitrile led to the formation of orange crystals suitable for XRD.

[Cr(ddpd)(tpy-COOEt)](PF<sub>6</sub>)<sub>3</sub>. A red solution of [Cr(ddpd)(SO<sub>3</sub>CF<sub>3</sub>)<sub>3</sub>] in distillated acetonitrile was loaded into a 5 ml MW vial containing tpy-COOEt (54 mg, 0.18 mmol). The solution was heated under microwave irradiation for 2h at 75°C. After cooling to room temperature, the solvent was removed under reduced pressure yielding an orange residue. ESI-MS (CH<sub>3</sub>CN) *m/z*: [Cr(ddpd)(tpy-COOEt)](SO<sub>3</sub>CF<sub>3</sub>)<sub>2</sub>]<sup>+</sup> calc: 945.9, found: 946.0. The orange residue was dissolved in ethanol (2 mL) and few drops of a saturated methanol solution of (*n*-Bu<sub>4</sub>)NPF<sub>6</sub> were added. The yellow precipitate was filtered and washed with cold MeOH (1 x 5 mL) and diethyl ether (2 x 15 mL) and finally dried under vacuum to give [Cr(ddpd)(tpy-COOEt)](PF<sub>6</sub>)<sub>3</sub> (110 mg, yield 65%) as a fine yellow powder. Slow diffusion of diethyl ether into a concentrated solution of the complex in acetonitrile led to the formation of orange crystals suitable for XRD.

#### Spectroscopic and analytical measurements.

<sup>1</sup>H and <sup>13</sup>C NMR spectra were recorded on a *Bruker Avance* 400 MHz spectrometer equipped with a variable temperature unit. Chemical shifts are given in ppm with respect to tetramethylsilane Si(CH<sub>3</sub>)<sub>4</sub>. Pneumatically-assisted electrospray (ESI) mass spectra were recorded from 10<sup>-4</sup> M solutions on an Applied Biosystems API 150EX LC/MS System equipped with a Turbo Ionspray source<sup>®</sup>. Elemental analyses were performed by K. L. Buchwalder from the Microchemical Laboratory of the University of Geneva. Microwave heating was performed in a Biotage initiator plus, producing continuous irradiation at 2.45 GHz. Reaction mixtures were stirred with a magnetic bar during irradiation. Absorption spectra in acetonitrile solution were recorded using a Lambda 1050 Perkin Elmer spectrometer (quartz cell path length 1 cm or 1 mm, 250-800 nm domain,  $2 \times 10^{-4}$  mol/L). Solid-state diffuse reflectance spectra were recorded using UV/Vis/NIR Perkin-Elmer Lambda 900 in reflectance (R) mode fitted with an integrating sphere. The pure samples were placed between two 1.0 mm path length quartz cells whose background cell was filled with pure MgO. The signal of pure MgO was used as the baseline. Emission spectra (excitation at 355 nm) and excitation spectra were recorded from frozen solution samples (acetonitrile/propionitrile 6/4 at  $C \approx 5 \times 10^{-3}$  mol/L), for powder samples at 77 K or from freeze pump thaw degassed acetonitrile solution ( $C \approx 10^{-4} \text{ mol/L}$ ) at 293 K, with a Fluorolog (Horiba Jobin-Yvon), equipped with iHR320, a Xenon lamp 450 Watt Illuminator (FL-1039A/40A) and a water-cooled photo multiplier tube (PMT Hamamatsu R2658 or R928), and corrected for the spectral response of the system. For time-resolved experiments, the decay curves were recorded from previously cited samples at 77K and 293K, with a photomultiplier (Hamamatsu R2658 or R928) and a digital oscilloscope (Tektronix MDO4104C). Pulsed excitation at 355 nm was obtained with the third harmonic of a pulsed Nd:YAG laser (Quantel Qsmart850). Low temperature (77 K) was achieved using liquid quartz transparent Dewar filled with liquid N<sub>2</sub> in the centre of which samples were placed. Microcrystalline samples or acetonitrile/propionitrile (6/4) solutions (C  $\approx 5 \times 10^{-3}$  mol/L), were introduced in quartz tube (4 mm interior diameter) introduced in sample holder of the Dewar. The oxygen free decay curve measurements were done at 293 K on acetonitrile solutions of the complex (C  $\approx 10^{-4}$ mol/L). The complexes in quartz tube were dissolved in acetonitrile then degassed by freeze pump thaw, and filled with argon. Aerated solutions were prepared by using no-degassed acetonitrile as solvent. All emission quantum yields were measured according to a comparative method using  $[Cr(ddpd)_2]^{3+}$  ( $\phi = 12.1$  %, CH<sub>3</sub>CN, room temperature,  $\lambda_{exc} =$ 

435nm) as reference.<sup>10</sup> Molar concentration were adjusted to  $1 \times 10^{-6}$  M for all complexes to ensure A < 0.1 at 435 nm.

### X-Ray Crystallography.

Summary of crystal data, intensity measurements and structure refinements for compounds **1** to **3** were collected in Tables S2, S5 and S8 (ESI). The crystals were mounted on MiTeGen cryoloops with protection oil. X-ray data collections were performed with an Agilent SuperNova Dual diffractometer equipped with a CCD Atlas detector (Cu[K $\alpha$ ] radiation) or a Rigaku symergy S equipped with an hypix detector (we thank Fraser White and the Rigaku team for assistance during data collection). The structures were solved in SHELXT by using dual space methods.<sup>A1-1</sup> Full-matrix least-square refinements on *F*<sup>2</sup> were performed with SHELXL<sup>A1-2</sup> within the Olex2 program.<sup>A1-3</sup> CCDC 1868830-1868832 contain the supplementary crystallographic data. The cif files can be obtained free of charge on www.ccdc.cam.ac.uk.
