Fig. S28: (a) Photos of the silica gel plates loaded with TNA or TNA-F were utilized to sense F\textsuperscript{-} and Fe\textsuperscript{3+} in aqueous solutions under UV lamp at 365 nm; (b) Fluorescence colour changes (under the UV lamp, at λ\textsubscript{ex} = 365 nm) of TNA-based test kit after addition of different concentration F\textsuperscript{-} aqueous solutions (from 0 M to 1 × 10\textsuperscript{-9} M).
Materials and instruments

All cations were used as the perchlorate salts, while all anions were used as the Tetrabutyl ammonium salts, which were purchased from Alfa Aesar and used as received. Fresh double distilled water was used throughout the experiment. Nuclear magnetic resonance (NMR) spectra were recorded on Varian Mercury 400 and Varian Inova 600 instruments. Mass spectra were recorded on a Bruker Esquire 6000 MS instrument. The infrared spectra were performed on a Digilab FTS-3000 Fourier transform-infrared spectrophotometer. Melting points were measured on an X-4 digital melting-point apparatus (uncorrected). The morphologies and sizes of the supramolecular polymer was characterized using field emission scanning electron microscopy (FE-SEM, UL TRA plus). The fluorescent information of the supramolecular polymer was characterized using Laser Scanning Confocal Microscope (LSCM, Olympus Fluoview FV1200). The X-ray diffraction analysis (XRD) was performed in a transmission mode with a Rigaku RINT2000 diffractometer equipped with graphite monochromated CuKa radiation (λ = 1.54073 Å). The thermal stability of the supermolecular polymer was characterized using Thermal Gravimetric Analyzer (TGA/DSC1). Fluorescence spectra were recorded on a Shimadzu RF-5301PC spectrofluorophotometer. Ion chromatography (IC) was recorded on Dionex ICS-1500.

General procedure:

1  F test kit preparation

The silica gel plate was been immersed in F− solution of different concentration, then it was aired at room temperature, obtaining the TNA or TNA-F film.

2  TNA or TNA-F film preparation

The TNA, TNA-F was heated to dissolve, then, it was dumped on the silica gel plate and aired at room temperature, obtaining the TNA or TNA-F film.

3  Adsorption experiment:

Solid powder of TNA (10.0 mg, 1.26 x 10−5 mol) was suspended in a dilute aqueous solution of F− (the concentration is about 2.61 mg/L in 10.0 mL) and stirred for 0.5 h. Then, the suspension was centrifuged at 10000 rpm for 5 min the precipitate was removed. Finally, the ingestion capacity of the TNA for F− in water was assessed by ion chromatography (IC) analysis.

4  Calculate method of adsorption percentage:

\[
\text{Adsorption percentage (\%) = } \left(1 - \frac{C_1 \times V_1}{C_0 \times V_0}\right) \times 100\%
\]

(State: \(C_1\) is the residual concentration of \(F^{-}\), \(C_0\) is the initial concentration of \(F^{-}\), \(V_1 = V_0\)).

5  Calculation formula of LOD:

Linear Equation: \(Y = aX + b\)

\[
\delta = \sqrt{\frac{\sum (x_i - \bar{x})^2}{n - 1}}
\]

\((n = 20)\)
\[
\delta = K \times S \quad (K = 3, S = a \times 10^6)
\]

6 Calculation formula of association constants (\(K_s\))

\[
\ln \frac{I_x - I_{\text{min}}}{I_{\text{max}} - I_x} = \ln K_s + n \ln [F^-]
\]

\[
K_s = 5.46 \times 10^9
\]

The stability constant (\(K_s\)) was determined by a nonlinear least squares fit of the data with the following equation as referenced elsewhere. \(I\) is the observed the fluorescence intensity of TNA at the fixed concentrations with the gradual addition of F. \(I_{\text{max}}\) and \(I_{\text{min}}\) are the corresponding maximum and minimum, respectively.

7 NMR experiments

(1) The host (TNA)-guest (F) \(^1\text{H}\) NMR titration:

The TNA (5 mg, 1 \times 10^{-2} \text{ mol}) was dissolved in the DMSO-\(d_6\) (0.5 ml), then a series of different equivalents of F- (0.2 equiv., 0.5 equiv., 1.0 equiv.) were added into the solution of TNA and recorded their \(^1\text{H}\) NMR respectively.

(2) The concentrations-dependent \(^1\text{H}\) NMR of TNA:

A serious of DMSO-\(d_6\) (0.5 ml) solutions of TNA with different concentrations (7.57 Mm; 12.6 mM; 17.7 mM; 27.8 mM) was prepared. Then record their \(^1\text{H}\) NMR respectively.

(3) The host (TNA)-guest (F) \(^{19}\text{F}\) NMR titration:

The tetrabutylammonium fluoride (3.8 \times 10^{-5} \text{ M}) was dissolved in the DMSO-\(d_6\) (0.5 ml), then a series of different equivalents of TNA (0.1 equiv., 0.5 equiv., 1.0 equiv.) were added into the solution of tetrabutylammonium fluoride and recorded their \(^{19}\text{F}\) NMR, respectively.

8 Fluorescence spectra experiments

All the fluorescence spectroscopy was carried out in DMSO/H\(_2\)O (7.4 : 2.6, v/v) solution on a Shimadzu RF–5301 spectrometer. With different equivalents tetrabutylammonium salt of anions (F-, CN-, I-, Cl-, N\(_3\)-, ClO\(_4\)-, H\(_2\)PO\(_4\)-, AcO-, HSO\(_4\)-, SCN-, Br-) were added into TNA while keeping the host concentration constant (1.0 \times 10^{-4} \text{ M}) in all the experiments. The detection limits for guest ions were determined by fluorescent titrations and calculated on the basis of 3\(\sigma/s\) method.

9 Study of FT-IR spectroscopy

FT-IR spectra were recorded on a Digilab FTS-3000 Fourier transform-infrared spectrophotometer. The solid powder of TNA, TNA-F and TNA-F + Fe\(^{3+}\) was prepared by drying a resulting gel on a glass slice for a long time. All the samples were mixed well-distributedly with KBr to create a compact pellet for the FT-IR detection.

10 Study of scanning electron microscopy (SEM)

Determination of the SEM images was performed on a JSM-6701F FE-SEM microscope. A SEM sample was fabricated by spreading the solid powder on conductive plastic. Then gold powder was sprayed on the sample after the detection system was vacuumized. The SEM image of the solid powder was determined with an accelerating voltage of 8 kV.
Scheme S1: Synthesis of TNA.

Synthesis of P1

The P1 was synthesized according to literature method. A mixture of Hydrazine hydrate (0.3182 g, 6 mmol, 80%), 1, 8-naphthalic anhydride (0.9901 g, 5 mmol) and alcohol (160.0 mL) were added to a 250 mL round-bottom flask under. The reaction mixture was stirred at 80 °C for 16 h. The solvent was removed and the residue was recrystallized in DMF and water to give the yellow needle-like solid (P1), (0.9434 g, 89%). M.P.: 265 °C. 1H NMR (400 MHz, DMSO-d$_6$, room temperature) δ (ppm): 8.47 (m, 4H), 7.86 (t, J = 8.0 Hz, 2H), 5.78 (s, 2H). 13C NMR (DMSO-d$_6$, 100 MHz): 160.48, 134.52, 130.80, 127.25, 126.00, 121.6. ESI-MS m/z: [P1+H]$^+$ Calcd C$_{12}$H$_8$N$_2$O$_2$ 213.07, found 213.00. FT-IR (anhydrous KBr, cm$^{-1}$) v: 3323, 3234 (NH$_2$), 1670 (C=O).

Fig.S1: 1H NMR Spectrum of P1 in DMSO-d$_6$ (400 MHz, 298K).
Fig.S2: $^{13}$C NMR Spectrum of P1 in DMSO-$d_6$ (100 MHz, 298K).

Fig.S3: ESI-MS of P1.
Synthesis of TNA:

A solution of 1, 3, 5-benzenetricarbonyl trichloride (1 mmol, 0.2657 g) was dropwise added into the mixture of P1 (4 mmol, 0.8482 g) and TEA (1 mL) in CH$_2$Cl$_2$. The mixture was stirred at room temperature for 15 h. The solvent was removed and the residue was recrystallized in DMF and alcohol, washed by alcohol and water. The product TNA was collected by filtration, and dried under vacuum (0.6256 g, 79%). M.P.: > 280 °C. $^1$H NMR (600 MHz, DMSO-$d_6$, room temperature) $\delta$ (ppm): 11.81 (s, 3H), 8.84 (s, 3H), 8.58 (m, 12H), 7.94 (t, $J = 6.0$ Hz, 6H). $^{13}$C NMR (DMSO-$d_6$, 150 MHz): 164.53, 162.13, 135.89, 131.95, 127.66, 121.94. HR-ESI-MS m/z: [TNA+Na]$^+$ Calcd C$_{45}$H$_{34}$N$_6$O$_9$Na 815.1497, found 815.14972.
Fig. S5: $^1$H NMR Spectrum of TNA in DMSO-$d_6$ (600 MHz, 298K).

Fig. S27: (a) A Job’s plot for the TNA and F, indicating the 1 : 1 stoichiometry for TNA-F. (b) Fluorescent “on-off-on” cycles of TNA-F, controlled by the alternate addition of Fe$^{3+}$ and F$^-$. 

Fig. S28: (a) Photos of the silica gel plates loaded with TNA or TNA-F were utilized to sense F$^-$ and Fe$^{3+}$ in aqueous solutions under UV lamp at 365 nm; (b) Fluorescence colour changes (under the UV lamp, at $\lambda_{ex} = 365$ nm) of TNA-based test kit after addition of different concentration F$^-$ aqueous solutions (from 0 M to $1 \times 10^{-8}$ M).
