General information

Thin layer chromatography (TLC) employed glass 0.25 mm silica gel plates. Flash chromatography columns were packed with 200-300 mesh silica gel in petroleum (boiling point is between 60-90 °C). Gradient flash chromatography was conducted eluting with a continuous gradient from petroleum to the indicated solvent, and they are listed as volume/volume ratios. NMR spectra were recorded on a Bruker spectrometer at 400 MHz (\(^1\)H NMR), 100 MHz (\(^{13}\)C NMR), 376 MHz (\(^{19}\)F NMR). Tetramethylsilane was used as an internal standard. All \(^1\)H NMR, \(^{13}\)C NMR and \(^{19}\)F NMR data spectra were reported in delta (δ) units, parts per million (ppm) downfield from the internal standard. Coupling constants are reported in Hertz (Hz).
Experimental procedure

General procedure for the preparation of imidazopyridines:[1]

A mixture of 2-bromoacetophenones (10.0 mmol, 1.0 equiv.), 2-aminopyridines (12.5 mmol, 1.25 equiv.) and NaHCO₃ (15.6 mmol, 1.56 equiv.) was stirred in ethanol at room temperature for 6 hours. After completion of the reaction, the resulting mixture was diluted with water (30 mL) and extract with ether (3 × 20 mL). The combined organic layer was washed with brine (25 mL), dried with anhydrous Na₂SO₄, concentrated under vacuum to give the crude product, which was purified by silica gel column with petroleum ether/ethyl acetate as the eluent to give the analytical pure imidazopyridines.

General procedure for the preparation of benzo[d]-imidazo[2,1-b]thiazoles:[2]

A mixture of benzo[d]thiazol-2-amine (12.0 mmol, 1.2 equiv.), acetophenone (10.0 mmol, 1.0 equiv.), iron(III) chloride (2 mmol, 0.2 equiv.) and zinc(II) iodide (1 mmol, 0.1 equiv.) was stirred in 1,2-dichlorobenzene under 110 °C for 15 h. After completion (TLC), the reaction mixture was cooled to room temperature and extracted with dichloromethane (10 mL) followed by washing with brine (5 mL) and dried over Na₂SO₄. After evaporation of solvent the crude product was purified by column chromatography on silica gel using petroleum ether/ethylacetate (9:1) as eluent.

General procedure for the preparation of substituted sulfonamide:[3,4]

Step 1: Substituted indole (6.0 mmol, 1.2 equiv.) was added to a mixture of CuI (95 mg, 0.5 mmol, 0.1 equiv.), K₃PO₄ (2.3 g, 10.5 mmol, 2.1 equiv.), substituted 2-idoaniline (5.0 mmol, 1.0 equiv.)
and N,N-dimethylethane-1,2-diamine (DMEDA) (88.1 mg, 1.0 mmol, 0.2 equiv.) in toluene (5 mL) at room temperature. The reaction tube was purged with argon and sealed with PTFE cap. After heated at 110 °C for 24 h, the mixture was cooled to room temperature, diluted with ethyl acetate (50 mL) and filtered through a plug of celite. The filtrate was concentrated in vacuo and the resulting residue was purified by silica gel column chromatography to give the 2-heteroaryl aniline, which was subsequently subjected to the next step.

**Step 2:** To a stirred solution of 2-heteroaryl aniline (1.0 mmol, 1.0 equiv.) in dry pyridine (2.0 mL), freshly recrystallized 4-substituted benzenesulfonyl chloride (1.1 mmol, 1.1 equiv.) was added. The reaction mixture was heated to reflux in dry nitrogen atmosphere until the reaction was completed by TLC analysis. Then, the reaction mixture was cooled, and diluted with water. After adjusting the pH to 1.5 by addition of 10% hydrochloric acid, the organic layer was extracted with ethyl acetate. The combined extracts were dried over anhydrous MgSO4 and solvent was removed by reduced pressure. The residue was purified by flash chromatography on silica gel to afford the desired products.

**General procedure for electrochemical intermolecular oxidative C−H/N−H cross-coupling reaction:** In an oven-dried undivided three-necked bottle equipped with a stir bar, 1 (0.3 mmol), 2 (0.6 mmol), NaNO3 (0.3 mmol) were combined and added. The bottle was equipped with graphite rod (ϕ 6 mm, about 18 mm immersion depth in solution) as the anode and nickel plate (15 mm × 15 mm × 1 mm) as the cathode and was then charged with nitrogen. Under the protection of N2, ethanol (1.2 mL), purified water (1.0 mL) and CH3CN (4.8 mL) were injected respectively into the tubes via syringes. The reaction mixture was stirred and electrolyzed at a constant current of 8 mA at 50 °C for 5 h. When the reaction was finished, the pure product was obtained by flash column chromatography on silica gel.

**General procedure for electrochemical intramolecular oxidative C−H/N−H cross-coupling reaction:** In an oven-dried undivided three-necked bottle equipped with a stir bar, 4 (0.3 mmol), Cp2Fe (20 mol%), tBu4NBF4 (0.3 mmol) were combined and added. The bottle was equipped with graphite rod (ϕ 6 mm, about 18 mm immersion depth in solution) as the anode and nickel plate (15 mm × 15 mm × 1 mm) as the cathode and was then charged with nitrogen. Under the protection of
N₂, ethanol (3.5 mL) and CH₃CN (3.5 mL) were injected respectively into the tubes via syringes. The reaction mixture was stirred and electrolyzed at a constant current of 8 mA at 70 °C for 4 h. When the reaction was finished, the pure product was obtained by flash column chromatography on silica gel.
