Experimental and methods

Chemicals and reagents

7,7,8,8-Tetracyanoquinodimethane (TCNQ, > 98.0%) was bought from TCI and 1,2,4,5-Tetracyanobenzene (TCNB, 99%) and potassium phthalimide salt (95%) were obtained from Fluorochem. Lead iodide (PbI₂, 99.999%) was obtained from Lumtec. 1-Pyrenebutyric acid (95%) was purchased from Combi-Blocks, Inc. Lithium aluminium hydride (LiAlH₄, 95%), carbon tetrabromide (CBr₄, 98%), potassium carbonate (K₂CO₃, 99+%), magnesium sulfate (MgSO₄, 99%), ammonium chloride (NH₄Cl, 99+%), triphenylphosphine (Ph₃P, 99%), hydrazine monohydrate (65%) and hydriodic acid (57 wt.% aqueous solution) were bought from Fisher Scientific. All chemicals were used without further purification. The dry dimethylformamide (DMF) that was used to make the precursor solutions, and dry tetrahydrofuran (THF) which was used for the reactions, was obtained from our in-house solvent-purification system (MBRAUN SPS-800). Chloroform (CHCl₃), dichloromethane (DCM) and ethyl acetate (EtOAc) were laboratory grade solvents (+99%) purchased from Fisher Scientific. Petroleum ether (PE), methanol (MeOH), ethanol (EtOH) and diethylether were technical solvents purchased from VWR.
**Synthesis of 1-Pyrenebutamine, hydriodide (PyrC₄)**

![Synthesis pathway of the PyrC₄NH₃⁺ salt.](image)

1-Pyrenebutanol (II): LiAlH₄ (2.0 g, 52 mmol) was dispersed in dry THF (15 mL) under N₂ atmosphere. The dispersion was heated to 85 °C (or until refluxing). A solution of 1-pyrenebutyric acid (I, 10 g, 35 mmol) in THF (15 mL) was added to the refluxing dispersion of LiAlH₄ in THF. The reaction was followed with thin layer chromatography (TLC). After the reaction was completed, after approximately 1h, a saturated solution of K₂CO₃ was added slowly to the reaction mixture. Next, the reaction mixture was extracted with 1M HCl (50 mL) and EtOAc (3 × 50 mL). Then, the organic layer was dried with magnesium sulfate, filtered and the solvent was removed by vacuum elimination. The residue was purified by flash chromatography (DCM), to obtain II as an off-white solid (8.8 g, 93%).

**1H NMR (400 MHz, Chloroform-d)**
δ 8.28 (d, J = 9.3 Hz, 1H), 8.19 – 8.16 (m, 1H), 8.15 (d, J = 2.5 Hz, 1H), 8.12 (d, J = 2.0 Hz, 1H), 8.10 (d, J = 3.4 Hz, 1H), 8.07 – 7.96 (m, 3H), 7.87 (d, J = 7.8 Hz, 1H), 3.71 (t, J = 6.5 Hz, 2H), 3.43 – 3.34 (m, 2H), 1.94 (m, 2H), 1.81 – 1.69 (m, 2H).

1-(Bromobutyl)pyrene (III): CBr₄ (13.3 g, 40.1 mmol), K₂CO₃ (6.7 g, 48.1 mmol) and II (8.80 g, 32.1 mmol) were dissolved in DCM (120 mL) under a N₂ atmosphere and cooled to 0 °C. A solution of Ph₃P (10.5 g, 40.1 mmol) in DCM (50 mL) was added to the former solution and the reaction mixture was allowed to warm up to room temperature, and stirred for 10 h. Afterwards, the reaction mixture was filtered and the filtrate was concentrated. The residue was purified by flash chromatography (8:1 PE:EtOAc), to obtain III as an off-white solid (10.8 g, 99.8%).

**1H NMR (400 MHz, Chloroform-d)**
δ 8.27 (d, J = 9.3 Hz, 1H), 8.20 – 8.17 (m, 1H), 8.16 (d, J = 2.5 Hz, 1H), 8.12 (d, J = 8.5 Hz, 2H), 8.09 – 7.97 (m, 3H), 7.86 (d, J = 7.8 Hz, 1H), 3.52 – 3.43 (m, 2H), 3.41 – 3.34 (m, 2H), 2.09 – 1.98 (m, 4H).

1H-Isoindole-1,3(2H)-dione, 2-[4-(1-pyrenyl)butyl]- (IV): potassium 1,3-dioxoisoundolin-2-ide (7.42 g, 40.1 mmol) and III (10.8 g, 32.0 mmol) were dissolved in DMF (50 mL), heated to 80 °C and stirred for 6 h. After the reaction was completed, aqueous NH₄Cl was added and the reaction mixture was extracted with CHCl₃ (3x 100 mL). Then, the organic layer was dried with magnesium sulfate, filtered and the solvent was removed by vacuum elimination. The residue was recrystallized from MeOH to obtain IV as an off-white solid (11.7 g, 90.4%).

**1H NMR (400 MHz, Chloroform-d)**
δ 8.26 (d, J = 9.3 Hz, 1H), 8.16 (d, J = 1.4 Hz, 1H), 8.14 (d, J = 1.8 Hz, 1H), 8.12 – 8.06
(m, 2H), 8.05 – 7.95 (m, 3H), 7.86 (d, J = 7.8 Hz, 1H), 7.82 – 7.75 (m, 2H), 7.68 – 7.62 (m, 2H), 3.76 (t, J = 6.8 Hz, 2H), 3.39 (t, J = 7.2 Hz, 2H), 2.01 – 1.81 (m, 4H).

1-Pyrenebutamine (V): Hydrazine monohydrate (65 wt. % in H₂O, 49 mL, 1.01 mol) was added to a refluxing solution of IV (11.7 g, 29.0 mmol) in EtOH (250 mL) and reacted overnight. Over the course of the reaction, large white crystals precipitate. After the reaction was completed, the reaction mixture was allowed to cool down to room temperature and the precipitate was filtered off and the solvent was removed by vacuum elimination. Next, the residue was dissolved in chloroform and again filtered. The filtrate was concentrated by rotary evaporation. Afterwards, an extraction was performed with basic water (pH = 12, 50 mL) and CHCl₃ (3 × 50 mL). Then, the organic layer was dried with magnesium sulfate, filtered and the solvent was removed by vacuum elimination to obtain V (7.48 g, 94.4%). ¹H NMR (400 MHz, Chloroform-d) δ 8.28 (d, J = 9.2 Hz, 1H), 8.17 (d, J = 2.5 Hz, 1H), 8.15 (d, J = 3.0 Hz, 1H), 8.12 (d, J = 2.5 Hz, 1H), 8.06 – 7.95 (m, 3H), 7.87 (d, J = 7.8 Hz, 1H), 3.40 – 3.29 (m, 2H), 2.76 (t, J = 7.1 Hz, 2H), 1.89 (tt, J = 9.4, 6.9 Hz, 2H), 1.72 – 1.53 (m, 2H).

1-Pyrenebutamine, hydriodide (VI): Hydrogen iodide was generated in situ and added to a solution of V in ethanol at room temperature. Afterwards, the solvent was evaporated. Next, the residue was redissolved in ethanol and precipitated in a large amount of cooled diethylether. The residue was further purified by recrystallization in ethanol to obtain VI as a white solid (10.7 g, quantitative yield). ¹H NMR (400 MHz, DMSO-d₆) δ 8.37 (d, J = 9.3 Hz, 1H), 8.28 (td, J = 8.0, 1.2 Hz, 2H), 8.25 – 8.21 (m, 2H), 8.17 – 8.11 (m, 2H), 8.06 (t, J = 7.6 Hz, 1H), 7.97 (d, J = 7.8 Hz, 1H), 7.60 (s, 3H), 3.46 – 3.20 (m, 4H), 3.01 – 2.73 (m, 2H), 1.84 (tt, J = 8.6, 6.2 Hz, 2H), 1.67 (tt, J = 8.9, 6.4 Hz, 2H).
Fig. S2. Liquid-state $^1$H-NMR spectrum of the Pyr$_4$NH$_3$I salt in DMSO-d$_6$. 
Preparing the precursor solutions

The compounds were dissolved together (Table S1) in dry DMF by stirring at 50 °C for 15 min, after which the solutions were allowed to cool down to room temperature. The solutions were filtered before use using a syringe filter (0.45 µm pore size).

Table S1 Concentration of chemicals used in precursor solutions for the preparation of films.

Deposition and annealing
Quartz substrates were cleaned by sonication in consecutively detergent water, deionized water, acetone and isopropanol. Prior to spin-coating, the substrates were further cleaned using a UV-ozone treatment for 15 minutes. The spin-coating was carried out in a glovebox (< 0.1 ppm O₂, < 0.1 ppm H₂O), the settings used were 2000 rpm, 2000 rpm/s, 20 s. The annealing of the films was performed on a hotplate in the glovebox, the films were annealed for 15 min at different temperatures. The annealing temperature that was used to obtain a certain sample is indicated in the relevant Figure captions.

Synthesis of single crystals of (PyrC₄)₂Pbl₄
The single crystals were grown using an antisolvent vapor-assisted crystallization approach² in which the components are dissolved together in a good solvent (y-butyrolactone; GBL) and dichloromethane (DCM) anti-solvent slowly diffuses into the GBL solution through the vapor phase. Specifically, PyrC₄NH₃I and PbI₂ were dissolved together in GBL by stirring at 50 °C for 15 min (Table S2). The precursor solution was filtered through a syringe filter (0.45 µm). The precursor solution (0.5 ml) was transferred to a small glass vial. The small vial (5 ml volume) was capped off with aluminum foil. A small hole was made in the aluminum foil. The small vial with the aluminum foil was put in a larger glass vial (20 ml volume). An amount of DCM (2 ml) was injected in the gap between the two vials and the larger vial was capped off with a plastic cap and parafilm. The vials were left undisturbed at room temperature. After 1 week light orange crystals suitable for single-crystal X-ray diffraction were harvested. These crystals were washed three times with dry dichloromethane and were subsequently dried under reduced pressure at room temperature.

Table S2 Concentration of chemicals used in precursor solutions for the preparation of single crystals.

Characterization
X-ray diffraction measurements were performed at room temperature in ambient air on a Bruker D8 Discover diffractometer with CuKα radiation. Temperature-controlled XRD measurements were performed on the same instrument with a temperature cell, under nitrogen flow.
Absorption spectra were measured on a Cary 5000 UV-Vis-NIR spectrophotometer from Agilent Technologies, a cleaned quartz substrate was used as calibration background.
Photoluminescence emission spectra were taken with a Horiba-Jobin Yvon Fluorolog-3 spectrofluorometer, equipped with double-grating excitation and emission monochromators and a 450 W Xe lamp as a light source. An excitation wavelength of either 300 nm or 430 nm was used (as indicated in the corresponding Figure captions).
For temperature-controlled UV-Vis, the precursor solution was spin coated onto a cleaned quartz disk and transferred to a temperature-controlled cell (custom made by Harrick Scientific Products, New York). The temperature was controlled using a temperature-controller from Watlow®. The temperature of the film is measured with a thermocouple touching the film. A heating ramp of 1 °C/min was used for the measurements. After the heating ramp, the system is left to cool down naturally to room temperature. The measurements were conducted under a nitrogen gas flow.

**Single crystal X-ray diffraction**

For the structure of the (PyrC₄)₂PbI₄ 2D layered hybrid perovskite, X-ray intensity data were collected at 100 K, on a Rigaku Oxford Diffraction Supernova Dual Source (Cu at zero) diffractometer equipped with an Atlas CCD detector using ω scans and MoKα (λ = 0.71073 Å) radiation. The images were interpreted and integrated with the program CrysAlisPro.³ Using Olex2⁴, the structure was solved by direct methods using the ShelXT structure solution program and refined by full-matrix least-squares on F² using the ShelXL program package.⁵,⁶ Non-hydrogen atoms were anisotropically refined and the hydrogen atoms in the riding mode and isotropic temperature factors fixed at 1.2 times U(eq) of the parent atoms.

*Crystal data for compound (PyrC₄)₂PbI₄ 2D layered hybrid perovskite. C₄₀H₄₀I₄N₂Pb, M = 1263.54, monoclinic, space group P2₁/c (No. 14), a = 25.0798(3) Å, b = 8.70360(10) Å, c = 8.76250(10) Å, β = 92.6530(10)°, V = 1910.67(4) Å³, Z = 2, T = 100 K, ρcalc = 2.196 g cm⁻³, μ(Cu-Kα) = 7.677 mm⁻¹, F(000) = 1176, 49790 reflections measured, 5140 unique (Rint = 0.0453) which were used in all calculations. The final R1 was 0.0211 (I >2σ(I)) and wR2 was 0.0451 (all data).*

Fig. S4. Absorption spectrum of a film of the PyrC₄:TCNQ 1:1 charge-transfer complex dried at 50 °C for 15 min (orange), a film of TCNQ dried at 110 °C for 5 min (blue) and a film of PyrC₄ dried at 110 °C for 5 min (black).

Fig. S5. (left) Absorption spectrum of a PyrC₄:TCNQ 1:1 complex in DMF. (right) Overlay of absorption spectra of a PyrC₄:TCNQ 1:1 complex in DMF (blue), TCNQ in DMF (orange) and PyrC₄ in DMF (black). The absorption peaks at ~ 850 nm and ~ 750 nm are assigned to a TCNQ radical anion⁷ formed in DMF⁸. The two sharp peaks at ~ 344 nm and ~ 328 nm are assigned to PyrC₄. The broad absorption band with a maximum at ~ 570 nm is not present for TCNQ or PyrC₄ separately and is assigned to charge-transfer absorption of the PyrC₄:TCNQ 1:1 complex in solution.
Fig. S6. Absorption spectrum of a thin film of the PyrC₄:TCNB 1:1 charge-transfer complex dried at 50 °C for 15 min (orange), a film of TCNB dried at 110 °C for 5 min (blue) and a film of PyrC₄ dried at 110 °C for 5 min (black).

Fig. S7. (left) Absorption spectrum of a PyrC₄:TCNB 1:1 complex in DMF. (right) Overlay of absorption spectra of a PyrC₄:TCNB 1:1 complex in DMF (blue), TCNB in DMF (orange) and PyrC₄ in DMF (black). charge-transfer absorption band starts at ~ 620 nm with a maximum at ~ 470 nm. Absorption below ~ 400 nm is related to TCNB and PyrC₄.
Fig. S8. (left) Unit cell of the (PyrC₄)₂PbI₄ 2D layered hybrid perovskite. (right) View along the a-axis. Visualization is performed using the VESTA package.⁹ The lead atoms are colored bright grey, the iodine atoms dark purple, the nitrogen atoms light blue, the hydrogen atoms light pink and the carbon atoms dark orange.

Fig. S9. (Left) Photoluminescence emission spectra of PyrC₄:TCNQ 1:1 (black) and PyrC₄:TCNB 1:1 (blue) films dried at 50 °C (absolute intensity). (Right) Photoluminescence emission spectrum of a (PyrC₄:TCNB 1:1)₂PbI₄ film annealed at 150 °C for 15 min (black) and a PyrC₄:TCNB 1:1 film dried at 50 °C (blue). All samples were excited at 430 nm.
Fig. S10. Absorption spectrum of a (PyrC₄:TCNB 2:1)ₓPbI₄ film annealed at 150 °C for 15 min (orange), of a (PyrC₄:TCNB 1:1)ₓPbI₄ film annealed at 150 °C for 15 min (black) and of a (PyrC₄)ₓPbI₄ film annealed at 150 °C for 15 min (blue). Two excitonic peaks are clearly present in the spectrum of (PyrC₄:TCNB 2:1)ₓPbI₄, belonging to (PyrC₄:TCNB 1:1)ₓPbI₄ and (PyrC₄)ₓPbI₄.

Fig. S11. Absorption spectrum of a (PyrC₄:TCNQ 2:1)ₓPbI₄ film annealed at 150 °C for 15 min (orange), of a (PyrC₄:TCNQ 1:1)ₓPbI₄ film annealed at 150 °C for 15 min (black) and of a (PyrC₄)ₓPbI₄ film annealed at 150 °C for 15 min (blue). In the spectrum of (PyrC₄:TCNQ 2:1)ₓPbI₄, the main excitonic peak corresponds to (PyrC₄:TCNQ 1:1)ₓPbI₄ while a shoulder at lower wavelength corresponds to (PyrC₄)ₓPbI₄. Note also that for (PyrC₄:TCNQ 2:1)ₓPbI₄ the charge-transfer absorption between 550 nm and 700 nm is much less pronounced than for (PyrC₄:TCNQ 1:1)ₓPbI₄.
Fig. S12. Emission spectrum of a (PyrC₄:TCNB 2:1)₂PbI₄ film annealed at 150 °C for 15 min (orange), of a (PyrC₄:TCNB 1:1)₂PbI₄ film annealed at 150 °C for 15 min (black) and of a (PyrC₄)₂PbI₄ film annealed at 150 °C for 15 min (blue). An excitation wavelength of 430 nm was used for all films. For (PyrC₄:TCNB 2:1)₂PbI₄ an excitonic emission peak belonging to (PyrC₄)₂PbI₄ is present at ~ 500 nm.

Fig. S13. Emission spectrum of a (PyrC₄:TCNQ 2:1)₂PbI₄ film annealed at 150 °C for 15 min (orange), of a (PyrC₄:TCNQ 1:1)₂PbI₄ film annealed at 150 °C for 15 min (black) and of a (PyrC₄)₂PbI₄ film annealed at 150 °C for 15 min (blue). An excitation wavelength of 430 nm was used. For (PyrC₄:TCNQ 2:1)₂PbI₄ a clear excitonic emission peak belonging to (PyrC₄)₂PbI₄ is present at ~ 500 nm. Note that in the (PyrC₄:TCNQ 1:1)₂PbI₄ film (black curve) made for this experiment there is also some small amount of (PyrC₄)₂PbI₄ present as indicated by the presence of a small shoulder at ~ 500 nm, likely related to a slight off-stoichiometry. All films were excited at 430 nm.
