## Impact of the XC functionals on the structural parameters and the absorption spectra for solvated systems

For isolated molecules in solution, optimization of the ground state has been carried out with three different functionals, namely PBE0, CAM-B3LYP and B3LYP. Key structural parameters have been carefully inspected and are gathered in Table SI. It shows that the structures are not impacted by the choice of the XC functionals, the variations being triffing when modifying the computational scheme used in the course of the geometry optimizations.

Table SI: Relevant structural parameters for the three tested functionals. See Figure 1 for the atom numbering.

		0			1	
	PBE0	CAM-B3LYP	B3LYP	PBE0	CAM-B3LYP	B3LYP

The first excitation energy was then calculated with 9 different combinations of TD//optimization computational schemes and compared to experimental data.<sup>1,2</sup> Results are shown on Figure S1 where the benchmark calculations have been carried out for the molecules 0 and 1. First, the energy difference  $|\Delta E_{exp-calc}|$  between calculated and experimental values are very similar for 0 and 1. Second, the geometry optimizations carried out with the CAM-B3LYP functional systematically lead to a large  $|\Delta E_{exp-calc}|$  value and this functional can thus be ruled out in the course of the geometry optimization. Thirdly, the calculation of the excitation energy with the same CAM-B3LYP functional also leads to larger  $|\Delta E_{exp-calc}|$  value compared to excited-sate calculations carried out with the PBE0 and B3LYP functionals for the same structure. For instance, the  $|\Delta E_{exp-calc}|$  values are respectively 0.12 eV and 0.19 eV for the B3LYP//B3LYP and CAM-B3LYP//B3LYP schemes for the molecule 0. At that stage, one can conclude that the B3LYP//B3LYP and PBE0//B3LYP strategies provide the same  $|\Delta E_{exp-calc}|$  values. For the sake of simplicity, we have thus decided to carry out geometry optimizations and TD-DFT calculations with the same XC functional, namely B3LYP. Indeed, with the B3LYP//B3LYP strategy, the  $|\Delta E_{exp-calc}|$  value is equal to 0.12 eV for both **0** and **1**.

Figure S1: Representation of the energy difference between the experimental and calculated excitation energies  $|\Delta E_{exp-calc}|$  in eV as a function of the TD//Optimization calculation scheme for **0** and **1**.

## Computed absorption spectra for solvated systems: molecules

## 0 and 1.

Table SII: Calculated absorption wavelength ( $\lambda$  in nm) along with oscillator strength (f) and electronic transition assignments for **0** and **1** in solution H and L denote HOMO and LUMO, respectively.

		0		1				
	$\lambda$	f	Assignment	$\lambda$	f	Assignment		
$Exp.^1$	360			373				
$S_1$	349	0.983	$\mathrm{H} \to \mathrm{L}$	360	0.740	$\mathrm{H} \to \mathrm{L}$		
$S_2$	335	0.084	$\text{H-1} \to \text{L}$	344	0.029	$\text{H-1} \to \text{L}$

Table SIX: Calculated frequencies  $(cm^{-1})$  for **5** in solution for the ground (top) and excited state (bottom).

## Crystalline systems: molecule 0

Figure S6: Left: Representation of the packing of system **0**. Distances (in angstroms) between the two (three) monomers that are involved in the dimer (trimer) are also indicated. Right: Representation of the cluster of 26 molecules used in the QM/QM' calculations.

Figure S7: Molecular orbitals calculated for the **0-M**, **0-D** and **0-T** models (isodensity = 0.025 au).

## Crystalline systems: molecule 1

Figure S8: Left: Representation of the packing of system 1. Distances (in angstroms) between the two monomers that are involved in the dimer are also indicated. Right: Representation of the cluster of 27 molecules used in the QM/QM' calculations.

Figure S9: Relevant molecular orbitals calculated for the 1-M and 1-D models (isodensity = 0.025 au).

Figure S10: Absorption spectra of the 1-M (black) and 1-D (red) models. The sticks have been convoluted with a Gaussian presenting a FWHM of 0.3 eV.

Figure S11: Low-frequency vibrational spectrum (0-500  $cm^{-1}$ ) calculated for the S<sub>1</sub>\*(K) structure for **1** in the crystalline phase. The vibrational mode corresponding to a large HR value in solution is given.

## Crystalline systems: molecules 2 to 5.

Figure S12: Representation of the packing structure of **2**. Distances (in angstroms) between the monomers that are involved in the trimer are also indicated.

Figure S13: Representation of the packing structure of **3**. Distances (in angstroms) between the two monomers that are involved in the dimer are also indicated.

Figure S14: Representation of the packing structure of **4**. Distances (in angstroms) between the two monomers that are involved in the dimer are also indicated.

Figure S15: Representation of the packing structure of **5**. Distances (in angstroms) between the two monomers that are involved in the dimer are also indicated.

Crystalline systems: Structural and spectral parameters.

Figure S16: Structure superposition of the optimized ground  $(S_0)$  and first excited state  $(S_1^*(E) \text{ for } \mathbf{0} \text{ and } S_1^*(K) \text{ for } \mathbf{1}, \mathbf{2}, \mathbf{3}, \mathbf{4} \text{ and } \mathbf{5})$  of the molecules in the crystal. One monomer is represented only. Ground and excited states are represented in blue and dark grey respectively.

Table SX: Absorption wavelength ( $\lambda$  in nm), oscillator strengths (f) and dominant molecular contributions in S<sub>0</sub>  $\rightarrow$  S<sub>n</sub> transitions for the different models for the compounds **2**, **3**, **4** and **5**. Only transitions with  $f \ge 0.15$  are given. H and L denote HOMO and LUMO respectively.

Models	State	$\lambda_{calc} (nm)$	f	Assignment)
2-M	$S_1$	360	0.626	$\mathrm{H} \to \mathrm{L}$
	$S_4$	303	0.181	$\mathrm{H} \rightarrow \mathrm{L{+}1}$
2-D	$S_2$	370	0.188	$\text{H-1} \to \text{L}$
	$S_4$	363	0.179	$\mathrm{H} \rightarrow \mathrm{L}{+1}$
2-T	$S_6$	364	0.120	$\text{H-1} \rightarrow \text{L+1}$
	$S_7$	360	0.103	$\text{H-2} \rightarrow \text{L+1}$
3-M	$S_1$	361	0.558	$\mathrm{H} \to \mathrm{L}$
	$S_5$	295	0.244	$\text{H-1} \rightarrow \text{L+1}$
3-D	$S_3$	368	0.296	$\mathrm{H} \rightarrow \mathrm{L}{+1}$
	$S_6$	356	0.562	$\text{H-2} \rightarrow \text{L}$
4-M	$S_1$	366	0.434	$\mathrm{H} \to \mathrm{L}$
4-D	$S_2$	363	0.273	$\mathrm{H} \rightarrow \mathrm{L{+}1}$
5-M	$S_1$	365	0.482	$\mathrm{H} \to \mathrm{L}$
5-D	$S_2^{-}$	367	0.885	$\text{H-1} \to \text{L}$

Figure S17: Low-frequency vibrational spectrum (0-500  $cm^{-1}$ ) calculated for the S<sub>1</sub>\*(K) structure for **2-4** in solution and in the crystalline environment.
