Boryl hydrides complex

The NBO analysis of the M-H terminal hydride hydrogenation in Co-boryl hydrides complex is shown in Fig. S4. This process contains mainly two stages. In stage I, the occupancies of the C¹-C² bond and the Co-H^a bond are 1.74 and 1.67, respectively, in the **1-RC**. Then in **1-A-TS₁**, accompanied with the disappears of the C¹-C² bond and the Co-H^a bond occupancies, the C¹-H^a bond and the Co-C² bond form. The orbital occupancies of the C¹-H^a bond and the Co-C² bond increases to 1.72 and 1.81, respectively to intermediate **1-A-IM** in stage II. In this electron evolution, two electrons transfer from Co-Ha to C1-Ha, and another two electrons transfer from π_{C1-C2} to Co-C², indicating a classical two-electron transfer process for the **2c-2e** terminal hydride in the boryl cobalt hydrides complexes.

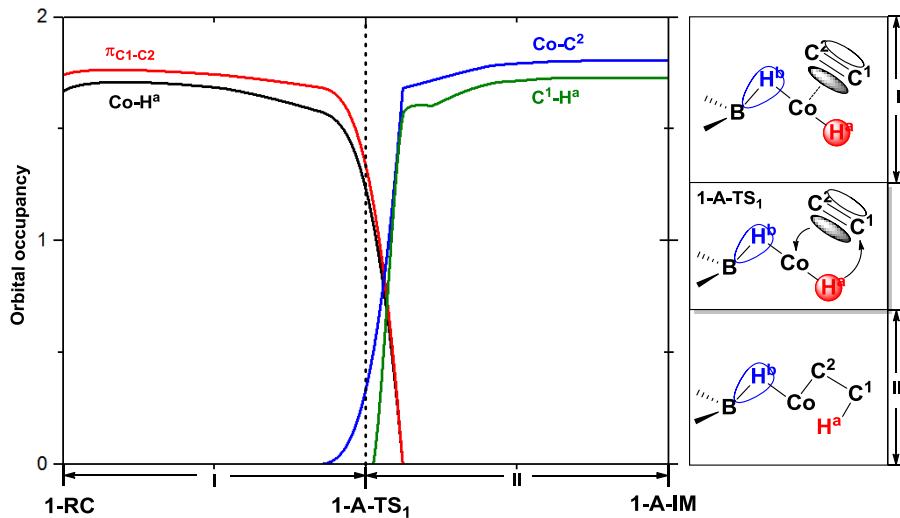

Fig. S4 NBO analysis along the terminal hydride hydrogenation process in the Co-boryl hydrides complex.

As shown in Fig. S5, the hydrogenation reaction by the B-H-Co bridging hydride contains three stages in total. In stage I, with the B-H^b bond occupancy drops from 1.62 to 0, the occupancy of the lone pair (LP) H appears. Meanwhile the occupancies of the C¹-C² bond and the d_{xz-yz} (Co) orbital keep above 1.74 and 1.64. Then in stage II, with the occupancies of the lone pair (LP) H^b and the d_{xz-yz} (Co) drop to 0, the Co-B bond and the Co-H^a bond form and their occupancies become higher than 1.74 and 1.51, respectively. In stage III which is after transition state 1-B-TS₁, accompanied with the occupancies of the Co-H^b bond and the C¹-C² bond drop to 0, the Co-C¹ bond and the C²-H^b bond appears to generate intermediate 1-B-IM.

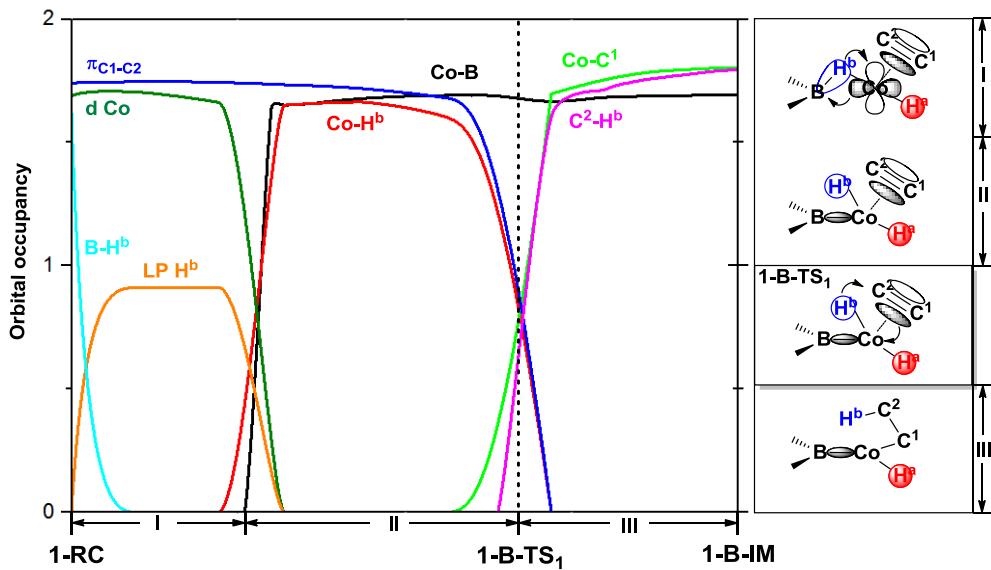

Fig. S5 NBO analysis along the bridging hydride hydrogenation process in the Co-boryl hydrides complex.

Borane hydrides complex

As for the M-H terminal hydride hydrogenation in the Ni-borane hydrides complex, electron evolution process is quite similarity to that in the Co-boryl system. As shown in Fig. S6, the C¹-C² and Ni-H^a continuous dropping from 1.85 and 1.77, respectively, to 0 in stage I, and the Ni-C² and C¹-H^a bond form in stage II. The hydrogenation process shows a typical two-electron transfer mode as well for the terminal hydride in the borane nickel hydrides complexes.

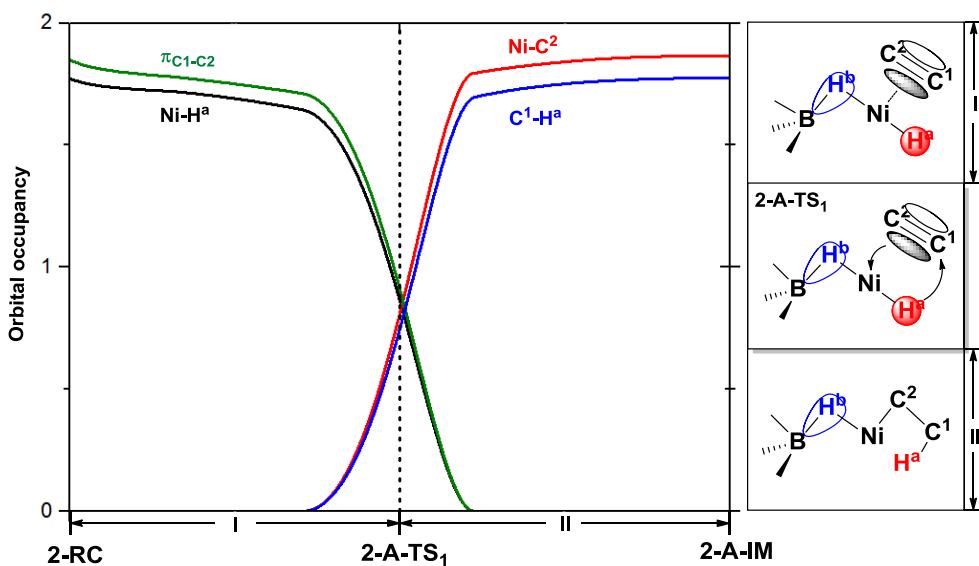

Fig. S6 NBO analysis along the terminal hydride hydrogenation process in the Ni-borane intermediate.

As for the B-H-Ni bridging hydride, the electron evolution includes three stages in hydrogenation reaction as well. However, the electronic structure is quite different from which in the boryl B-H-Co bridging hydride. As shown in Fig. S7, in stage I, occupancies of the B-H^b bond continuously drops from 1.63 to 1.53, indicating the weakness of the B-H^b bond. Then in stage II, with the breaking of the B-H^b bond, the lone pair (LP) H^b and the p_z orbital of boron atom appears. Meanwhile, the occupancy of the C¹-C² bond drops from 1.85 to 1.62, suggesting the activation of the C-C bond. After 2-B-TS, with the occupancies of the lone pair (LP) H^b and the C¹-C² bond drop from 0.83 and 1.32 to 0, the C²-H^b bond forms finally.

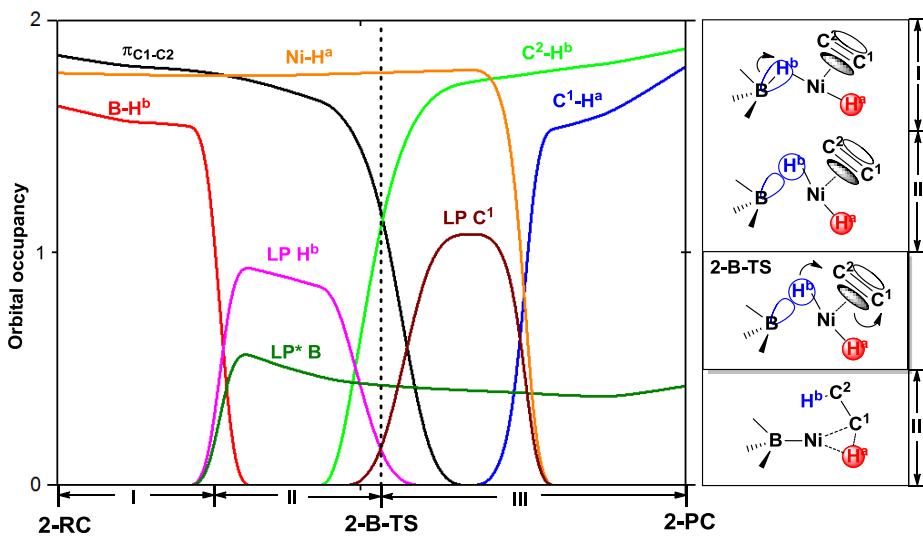

Fig. S7 NBO analysis along the bridging hydride hydrogenation process in the Ni-borane hydrides complexes.

5. The Calculated Results of Orbital Occupancy for M-H and M-H-B Hydrogenation Reaction in Co-boryl and Ni-borane System.
