1. General Information

Unless otherwise noted, all commercially available reagents were used without further purification. Deionized water was degassed by sparging with argon prior to use. Solutions of 2 wt% surfactant in degassed water was prepared by dissolving 2 g surfactant in 98 g degassed water and stored in a glass container with a septum on the bench-top. Starting materials were prepared applying reference procedures. Photoredox-catalyzed were conducted in a sealed 10 mL tube irradiated with a 20 W household white CFL. The CFL was purchased directly from supermarket shelves. Analytical thin-layer chromatography was performed on glass plates precoated with silica gel, and compounds were detected by visualization under an ultraviolet lamp (254 nm). Starting materials were prepared applying reference procedures. Column chromatography was carried out using Silica gel. NMR solvents were purchased from Cambridge Isotopes Laboratories. $^1$H, $^{13}$C and $^{19}$F NMR spectra were recorded on an AVANCE III 500 Bruker spectrometer operating at 500 MHz, 125 MHz and 470 MHz, respectively. Chemical shifts were reported in ppm. Coupling constants ($J$ values) are reported in Hz. UV-vis absorption measurements were performed using a Perkin Elmer Lambda 750 spectrophotometer at room temperature.

2. General Methods and Product Characterization

Typical procedure for photocatalytic arylation of heteroarenes in water. Aniline (0.5 mmol) and Eosin B (1 mol%, 3 mg) were added to an oven dried 10 mL tube containing a PTFE-coated magnetic stir bar. 2 mL aqueous solution of 2 wt% Triton X-100 was added via syringe, and heteroarene (2.5 mmol or 1.5 mmol) was then added. The reaction tube was closed with a rubber septum. The mixture was stirred for 1 min before tert-Butyl nitrite (1 mmol, 120 µL) was added slowly via syringe while stirring. The resulting mixture was stirred and irradiated under a 20 W household white CFL at room temperature for 2 h. After completion, the mixture was extracted in flask with ethyl acetate (5 mL x 3). The organic phase was collected and the volatiles was removed under reduced pressure. The crude product was purified by flash column chromatography on silica gel to afford the title compounds.

3. UV-Vis Absorptions of Eosin B in Different Solvents

![Graph showing UV-Vis absorptions of Eosin B in different solvents](image)

Note: For UV-vis measurements, solutions were processed with the concentration of 20 μM. The molar ratio of Eosin B to Triton X-100 was kept at 3:40, in accordance of the ratio as applied in the photoredox catalysis setting. TX100 is short for Triton X-100.

4. Recycling of the Aqueous Reaction Medium

4-Chloroaniline (0.5 mmol, 64 mg) and Eosin B (1 mol%, 3 mg) were added to an oven dried 10 mL tube containing a PTFE-coated magnetic stir bar. 2 mL aqueous solution of 2 wt% Triton X-100 was added via syringe, and furan (2.5 mmol, 181 μL) was then added. The reaction tube was closed with a rubber septum. The mixture was stirred for 1 min before tert-Butyl nitrite (1 mmol, 120 μL) was added slowly via syringe while stirring. The resulting mixture was stirred and irradiated under a 20 W household white CFL at room temperature for 2 h. After completion, the mixture was extracted in flask with ethyl acetate (3 mL x 3). The organic phase was collected and the volatiles was removed under reduced pressure. The crude product was purified by flash column chromatography on silica gel to afford the title compounds. To the aqueous phase containing the surfactant was added 4-Chloroaniline (0.5 mmol) and Eosin B (1 mol%, 3 mg). The mixture was then deoxygenated by three freeze-pump-thaw cycles before the addition of furan (2.5 mmol, 181
μL. tert-Butyl nitrite (1 mmol, 120 μL) was added slowly via syringe while stirring. The resulting mixture was stirred under a 20 W household white CFL at room temperature for 2 h. The work up was conducted in exactly the same way as described for the first run, and the aqueous phase containing the surfactant was reused to start the next cycle. The next two cycles were conducted according to the second run.

5. Experiments for the Mechanistic Study

Radical capturing experiment with TEMPO.

4-Nitroaniline (0.5 mmol, 69 mg), 2,2,6,6-tetramethyl-1-piperidinyloxy (TEMPO) (0.75 mmol, 118 mg) and Eosin B (1 mol%, 3 mg) were added to an oven dried 10 mL tube containing a PTFE-coated magnetic stir bar. 2 mL aqueous solution of 2 wt% Triton X-100 was added via syringe. The reaction tube was closed with a rubber septum. The mixture was stirred for 1 min before tert-Butyl nitrite (1 mmol, 120 μL) was added slowly via syringe while stirring. The resulting mixture was stirred and irradiated under a 20 W household white CFL at room temperature for 2 h. After completion, the mixture was extracted in flask with ethyl acetate (5 mL x 3). The organic phase was collected and the volatiles was removed under reduced pressure. The crude product was purified by flash column chromatography on silica gel to afford the adduct 10.

2,2,6,6-Tetramethyl-1-(4-nitrophenoxy)piperidine (10).

Light on/off experiment.

4-Chloroaniline (0.5 mmol, 64 mg) and Eosin B (1 mol%, 3 mg) were added to an oven dried 10 mL tube containing a PTFE-coated magnetic stir bar. 2 mL aqueous solution of 2 wt% Triton X-100 was added via syringe, and furan (2.5 mmol, 181 μL) was then added. The reaction tube was closed with a rubber septum. The mixture was stirred for 1 min before tert-Butyl nitrite (1 mmol, 120 μL) was added slowly via syringe while stirring. The resulting mixture was stirred under a 20 W household white CFL at room temperature for 5 min. 50 μL of the reaction mixture was taken from the reaction tube and was analyzed by GC with n-dodecane as internal standard. The tube was then
covered with aluminum foil and the reaction mixture was stirred in the dark for 5 min. Another 50 µL of the reaction mixture was taken and analyzed by GC. This procedure was repeated for two runs. The time profile is shown in the following figure.
