Experimental section
**Materials:** 2,4,6-trinitrophenol (TNP), 4-nitrophenol (4-NP), 2-nitrophenol (2-NP), 2-nitrophenol (3-NP), 2-nitrotoluene (2-NT), nitrobenzene (NB), 2,4-dinitrotoluene (2,4-DNT), and 1,3-dinitrobenzene (1,3-DNB) were provided by Shandong Asia Chemical Industry Co. Ltd. (China). All the antibiotics including nitro-furazon (NZF), furazolidone (FZD), nitrofurantoin (NFT), dimetridazole (DTZ), ronidazole (RDZ), ornidazole (ODZ), and metronidazole (MDZ) were purchased from Blue Gene (Shanghai, China). Zn(NO$_3$)$_2$, 5-aminoisophthalic acid (H$_2$aip, L1), isophthalic acid (Hip, L2), and 1,3,5-benzenetricarboxylic acid (BTC, L3) were obtained by the Aladdin (Shanghai, China). N4, N4’-di(pyridine-4-yl)biphenyl-4,4’-dicarboxamide) (L) was synthesized according to our previous reports$^{1,2}$. All other reagents were purchased commercially and used without further purification.

**Physical measurements:** Scanning electron microscope images were measured using a Phenom Pure desktop scanning electron microscope. Ultraviolet-visible adsorption spectra were recorded at room temperature on a PerkinElmer Lambda 35 spectrophotometer. Infrared spectra on KBr pellets were obtained using a Bruker Equinox-55 spectrophotometer. Powder X-ray diffraction (PXRD) patterns were obtained using a D/Max-2500 X-ray diffractometer using Cu Ka ($\lambda = 1.54$ Å) radiation. Fluorescence spectra were obtained using a Hitachi F-7000 fluorescence spectrophotometer at room temperature.

**Preparation of MOFs:** Typically, Zn(NO$_3$)$_2$, L, and H$_2$aip (L1) / Hip (L2) / H$_3$BTC (L3) with a ratio of 1:1:1 were dissolved in 6 mL of DMF/H$_2$O (5:1) solution, then the mixture was transferred into a Teflon reactor and heated at 393 K for 48 h. After cooling to room temperature, the mixture was centrifuged and washed with DMF twice to obtain the light-yellow powder.

**Nitro explosives or antibiotics sensing experiments:** MOFs (1, 2, or 3) were dispersed in pure water with the concentration of 50 μg/mL, and treated via ultrasonication for 30 mins to form a stable emulsion. Then a series of nitro explosives or antibiotics solution with the various concentrations were respectively added to the emulsion of MOFs before carrying out the fluorescence studies.
